**Coal and Coal-Related Compounds** Toshiaki Kabe,Atsushi Ishihara,Eika Weihua Qian,I. Putu Sutrisna,Yaeko Kabe,2004-11-18 Coal is more abundant than petroleum and natural gas Further coal is not localized but can be used by many more countries than petroleum Therefore if we can establish coal utilization technology coal will bring about a great contribution to human life and society On the other hand shortage of petroleum and natural gas are anticipated in the second half of the 21st century To compensate the use of coal is expected to gradually increase during the 21st century In the future the development of the coal utilization technology will become more and more important to insure the supply of liquid fuels for transportation and carbon sources for the manufacture of chemicals and plastic materials In order to develop such technologies the elucidation of the structure of coal is a fundamental area of study Further more efficient coal utilization technology must be established to meet environmental legislation One of the key technologies for this purpose is catalysis This volume provides detail of the basic and practical aspects of the science and technology of coal utilization with and without catalysts The actual structure of coal the chemistry included in the reactivity of coal the methods to elucidate the structure of coal and reaction mechanisms of coal conversion the most important catalyst for converting coal to liquid and gas the role of the catalysts in coal conversion the problems in the process engineering and how to meet environmental regulations are discussed in detail The recent

progress in studies on the structure and reactivity of coal made over the last century is summarized and reviewed with emphasis on both fundamental and applied aspects of the science and technology for coal processing in the presence and absence of catalysts This book highlights the issues faced in trying to discover more efficient coal utilization technology Provides detailed discussion on how to meet environmental regulations and legislation Fills the gap between both the scientific and practical sides of coal utilization with and without catalysts **Molecular sieves** ,2005 Process Intensification for Sustainable Energy Conversion Fausto Gallucci,Martin van Sint Annaland,2015-07-07 This book addresses the application of process intensification to sustainable energy production combining two very topical subject areas Due to the increasing process of petroleum sustainable energy production technologies must be developed for example bioenergy blue energy chemical looping combustion concepts for CO<sub>2</sub> capture etc Process intensification offers significant competitive advantages because it provides more efficient processes leading to outstanding cost reduction increased productivity and more environment friendly processes **Environmental Challenges and Greenhouse Gas Control for Fossil Fuel Utilization in the 21st Century** M. Mercedes Maroto-Valer,Chunshan Song,Yee Soong,2002-08-31 As we are moving ahead into the 21st century our hunger for cost effective and environmentally friendly energy continues to grow The Energy Information Administration of US has forecasted that only in the first two decades of the 21st century our energy demand will increase by 60% compared to the levels at the end of the 20th century Fossil fuels have been traditionally the major primary energy sources worldwide and their role is expected to continue growing for the forecasted period due to their inherent cost competitiveness compared to non fossil fuel energy sources However the current fossil energy scenario is undergoing significant transformations especially to accommodate increasingly stringent environmental challenges of contaminants like sulfur dioxide nitrogen oxides or mercury while still providing affordable energy Furthermore traditional fossil fuel utilization is inherently plagued with greenhouse gas emissions from combustion especially carbon dioxide from stationary sources as well as from mobile sources Should worldwide government policies dictate a reduction of greenhouse gas emissions such as proposed by the Kyoto Protocol and the implementation of carbon taxes fossil fuels would lose their significant competitive appeal in favor of nuclear energy and renewable energy sources However the current non fossil fuel energy share of the worldwide energy market is merely below 15% and therefore it is more likely that fossil fuel energy producers would adapt to the new requirements by developing and implementing emission control technologies and emission trades among other strategies **Catalyst Deactivation 2001** J.J. Spivey,G.W. Roberts,B.H. Davis,2001-09-21 This proceedings contains the papers presented at the 9th International Symposium on Catalyst Deactivation held in Lexington KY USA on 7 10 October 2001
