Stochastic Models For Laser Propagation In Atmospheric Turbulence:

Stochastic Models for Laser Propagation in Atmospheric Turbulence Robert P. Leland, 2014-03-12 This monograph considers stochastic models for laser propagation in atmospheric turbulence in a Hilbert space context The laser beam intensity is formulated as the solution to a random Schroedinger equation This model is considered as an abstract bilinear system with a multiplicative white noise input This monograph applied the Hilbert space valued white noise theory to the laser distortion problem and relates it to the Wiener process formulation This monograph will be of interest to researchers working in stochastic differential equations as well as engineers and physicists working in atmospheric optics The monograph is intended for readers who have taken a graduate course in functional analysis and probability

Differential and Algebraic Riccati Equations with Application to Boundary/point Control Problems Irena Lasiecka, Roberto Triggiani, 1991 This book provides in a unified framework an updated and rather comprehensive treatment centered on the theory of optimal control with quadratic cost functional for abstract linear systems with application to boundary point control problems for partial differential equations distributed parameter systems The book culminates with the analysis of differential and algebraic Riccati equations which arise in the pointwise feedback synthesis of the optimal pair It incorporates the critical topics of optimal irregularity of solutions to mixed problems for partial differential equations exact controllability and uniform feedback stabilization It covers the main results of the theory which has reached a considerable degree of maturity over the last few years as well as the authors basic philosophy behind it Moreover it provides numerous illustrative examples of boundary point control problems for partial differential equations where the abstract theory applies However in line with the purpose of the manuscript many technical proofs are referred to in the literature Thus the manuscript should prove useful not only to mathematicians and theoretical scientists with expertise in partial differential equations operator theory numerical analysis control theory etc but also to those who simply wish to orient themselves with the scope and status of the theory presently available Both continuous theory and numerical approximation theory thereof are included

On Moment Theory and Controllability of One-dimensional Vibrating Systems and Heating Processes Werner Krabs, 1992 The main concern

of this book is the application of infinite moment theory to the problem of controllability of one dimensional vibrating systems like strings and beams and heating processes. Distributed as well as boundary control is considered. In the case of vibrating systems trigonometric moment problems are to be investigated which is done on the basis of an abstract moment theory in Hilbert spaces. Equivalently also the theory of linear operator equations on Hilbert spaces partly with unbounded operators is applied to the problem of controllability and time minimal controllability. In the case of heating processes exponential moment problems are to be dealt with which is done on the basis of an abstract moment theory in Banach spaces. Time minimal controllability is also treated with the aid of the theory of linear operator equations on Banach spaces. Some advanced knowledge in functional analysis and on partial differential equations is preassumed for a fluent reader of the book but parts of it are also readable with basic mathematical knowledge for instance the finite dimensional part of the introduction.
