Carroll G. Thronesbery, 1998 The characteristics of this field guide approach address the problems of designing innovative software to support user tasks The requirements for novel software are difficult to specify a priori because there is not sufficient understanding of how the users tasks should be supported and there are not obvious pre existing design solutions When the design team is in unfamiliar territory care must be taken to avoid rushing into detailed design requirements specification or implementation of the wrong product The challenge is to get the right design and requirements in an efficient cost effective manner This document s purpose is to describe the methods we are using to design human interactions with intelligent systems which support Space Shuttle flight controllers in the Mission Control Center at NASA

Johnson Space Center Although these software systems usually have some intelligent features the design challenges arise primarily from the innovation needed in the software design While these methods are tailored to our specific context they should be extensible and helpful to designers of human interaction with other types of automated systems We review the unique features of this context so that you can determine how to apply these methods to your project Throughout this field guide goals of the design methods are discussed This should help designers understand how a specific method might need to be adapted to the project at hand

Designing Human-Swarm Interaction Systems Oscar Bjurling, 2025-02-20 Swarms of Unmanned Aerial Vehicles UAVs or drones are envisioned to transform various fields from emergency response to law enforcement and military operations Drone swarms provide scalable adaptable and decentralized solutions for dynamic work environments However the successful integration of these multi agent systems into real world settings presents significant challenges particularly in terms of how humans can safely and effectively interact with and control these systems Human Swarm Interaction HSI aims to address these challenges by exploring how human operators can manage multiple drones in a cohesive manner even under highly complex uncertain conditions This thesis studies the problem of designing effective interaction mechanisms and interfaces for human operators to command drone swarms specifically addressing challenges such as managing a large number of drones supporting operators situational awareness and balancing between centralized and decentralized control The research highlights the necessity of rethinking conventional approaches by introducing alternative conceptual models such as the choir metaphor which reimagines drone swarms as coordinated semi centralized ensembles rather than purely emergent decentralized collectives This metaphor aims to balance the collective often unpredictable behavior of drone swarms with the predictable directed actions needed in operational environments By demonstrating how this metaphor can be operationalized in an HSI system architecture the thesis provides new avenues for conceptualizing human interaction with autonomous systems Using a design research approach incorporating multiple case study and scenario based design activities to envision future swarm application in dialogue with prospective end users the thesis develops and evaluates prototypes that embody these nuanced HSI concepts The interface prototypes draw design inspiration from Real Time Strategy RTS games These elements include group commands high level mission planning and resource pooling to create a hybrid interaction model that allows operators to maintain both a broad overview and precise control of multiple autonomous and collaborating drones Domain expert evaluations of these prototypes in contexts such as firefighting and airport management validate the practical utility of these concepts The findings emphasize the value of adopting a Human Technology Organization HTO perspective in the design of HSI systems Rather than focusing solely on the interaction between humans and technology this systems thinking approach acknowledges that drone swarms must be integrated into larger organizational frameworks such as emergency response command structures or airport ground operations teams It demonstrates that successful deployment requires accounting for the broader organizational context

including roles workflows and coordination needs This holistic approach to HSI system design ensures that drone swarms not only meet technical performance criteria such as reliability responsiveness and scalability but also align with human and organizational needs facilitating their adoption and effective use in a wide range of real world scenarios Ultimately these contributions are intended to bridge the gap between theoretical models of swarm control and practical deployment advancing both the field of HSI and the broader adoption of drone swarm technologies

Ahram, Redha Taiar, 2021-09-09 This book reports on research and developments in human technology interaction. A special emphasis is given to human computer interaction and its implementation for a wide range of purposes such as health care, aerospace, telecommunication and education among others. The human aspects are analyzed in detail. Timely studies on human centered design, wearable technologies, social and affective computing, augmented virtual and mixed reality simulation, human rehabilitation and biomechanics represent the core of the book. Emerging technology applications in business, security and infrastructure are also critically examined, thus offering a timely, scientifically grounded but also professionally oriented snapshot of the current state of the field. The book gathers contributions presented at the 5th International Conference on Human Interaction and Emerging Technologies (IHIET 2021, August 27-29, 2021) and the 6th International Conference on Human Interaction and Emerging Technologies Future Systems (IHIET FS 2021, October 28-30, 2021) held virtually from France. It offers a timely survey and a practice oriented reference guide to researchers and professionals dealing with design, systems engineering and management of the next generation technology and service systems.

Human Interaction with Complex Systems Celestine A. Ntuen, Eui H. Park, 2012-07-01 Human system interaction has been and will continue to be of interest to many researchers of various disciplines: engineers, computer scientists, psychologists and social scientists. The research in Human System Interaction (HSI) has progressed from the era of using anthropomorphic data to design workspace to the current period which utilizes human and artificial sensors to design sensory based cooperative workspace. In either of these developments, HSI has been known to be complex. In 1994 we initiated a series of symposiums on Human Interaction with Complex Systems. It was then that various ideas surrounding HSI for today and tomorrow were discussed by many scientists in the related disciplines. As a follow up in 1995 the Second Symposium was organized. The objective of this symposium was to attempt to define a framework, principles and theories for HSI research. This book is the result of that symposium. The 1995 symposium brought together a number of experts in the area of HSI. The symposium was more focused on expert opinions and testimonies than traditional meetings for technical papers. There were three reasons for that approach.

Designing Human Interface in Speech Technology Fang Chen, 2006-03-06 Designing Human Interface in Speech Technology bridges a gap between the needs of the technical engineer and cognitive researchers working in the multidisciplinary area of speech technology applications. The approach is systematic and the focus is on the utility of developing and designing speech related products. Included is coverage of topics such as neuroscience on the multimodal cortex, cognitive theories on multi task performance, stress and workload as well as human information process theory and ecological interface design theory for evaluating speech related human system interfaces. Of special emphasis are topics such as spoken dialogue system design in vehicle communication system design and speech technology in military applications. Also included are tools on how to analyze the design, different design theories and process methods about how to understand users. The material systematically describes the user center design process and usability evaluation methods. Designing
