Stochastic Differential and Difference Equations Imre Csiszar, Gy. Michaletzky, 2012-12-06 Computational Information Geometry Frank Nielsen, Frank Critchley, Christopher T. J. Dodson, 2016-11-24 This book focuses on the application and development of information geometric methods in the analysis classification and retrieval of images and signals It provides introductory chapters to help those new to information geometry and applies the theory to several applications This area has developed rapidly over recent years propelled by the major theoretical developments in information geometry efficient data and image acquisition and the desire to process and interpret large databases of digital information The book addresses both the transfer of methodology to practitioners involved in database analysis and in its efficient computational implementation *Directions in Mathematical Systems Theory and Optimization* Anders Rantzer, Christopher I. Byrnes, 2003-07-01 For more than three decades Anders Lindquist has delivered fundamental contributions to the fields of systems signals and control Throughout this period four themes can perhaps characterize his interests Modeling estimation and filtering feedback and robust control His contributions to modeling include seminal work on the role of splitting subspaces in stochastic realization theory on the partial realization problem for both deterministic and stochastic systems on the solution of the rational covariance extension problem and on system identification His contributions to filtering and estimation include the development of fast filtering algorithms leading to a nonlinear dynamical system which computes spectral factors in its steady state and which provide an alternate linear in the dimension of the state space to computing the Kalman gain from a matrix Riccati equation His further research on the phase portrait of this dynamical system gave a better understanding of when the Kalman filter will converge answering an open question raised by Kalman While still a student he established the separation principle for stochastic function differential equations including some fundamental work on optimal control for stochastic systems with time lags He continued his interest in feedback control by deriving optimal and robust control feedback laws for suppressing the effects of harmonic disturbances Moreover his recent work on a complete parameterization of all rational solutions to the Nevanlinna Pick problem is providing a new approach to robust control design **Information Geometry** Geert Verdoolaege, 2019-04-04 This Special Issue of the journal Entropy titled Information Geometry I contains a collection of 17 papers concerning the foundations and applications of information geometry Based on a geometrical interpretation of probability information geometry has become a rich mathematical field employing the methods of differential geometry It has numerous applications to data science physics and neuroscience Presenting original research yet written in an accessible tutorial style this collection of papers will be useful for scientists who are new to the field while providing an excellent reference for the more experienced researcher Several papers are written by authorities in the field and topics cover the foundations of information geometry as well as applications to statistics Bayesian inference machine learning complex systems physics and neuroscience Journal of analysis and its
