difference in the response outcomes may be due to the combined influence of more than one factor In non experimental data where the treatment is not randomly assigned but self selected the subjects tend to differ in observed or unobserved characteristics It is therefore imperative that the comparison be carried out with subjects similar in their characteristics This book explains how this problem can be overcome so the attributable effect of the treatment can be found This book brings to the fore recent advances in econometrics for treatment effects The purpose of this book is to put together various economic treatments effect models in a coherent fashion make it clear which can be parameters of interest and show how they can be identified and estimated under weak assumptions The emphasis throughout the book is on semi and non parametric estimation methods but traditional parametric approaches are also discussed This book is ideally suited to researchers and graduate students with a basic knowledge of econometrics
