**Sustainability Impact Assessment of Land Use Changes** Katharina Helming, Marta Pérez-Soba, Paul Tabbush, 2008-06-11 There are many reasons why strategic intelligence is required to support policy decisions These primarily stem from the nature of today's knowledge society with two contrasting trends On the one hand there is a trend of increasing human intelligence in the economic social and political systems On the other hand there is a trend towards dissolving certainties about the problems and solutions of today's society Clearly more information does not necessarily imply more certainties on how to act What is more the same facts are often interpreted in markedly different ways the same policy relevant information can and often does result in conflicting framing of a problem by different stakeholders This is mainly due to competing assumptions rather than because of inconsistent facts Therefore it is not surprising that policy makers are calling for strategic intelligence to support their understanding of today's challenges including the relevant aspects of science and technology their impact and their possible future developments Over the last 15 years Europe has rapidly adopted the practice of developing and using Impact Assessment (IA) tools to support decision making Formal procedures and guidance for IA are well established within the European Commission and in most EU Member States The adoption of IA procedures alone however does not guarantee that every policy domain is actually using the full potential of these assessment tools in the preparation of policies and legislation

**Systems for Sustainability** Frank A. Stowell, Ray L. Ison, Rosalind Armson, Jacky Holloway, Sue Jackson, Steve McRobb, 2013-11-11 The term sustainability has entered the lexicon of many academic disciplines and fields of professional practice but to date does not appear to have been seriously considered within the systems community unless perhaps under other guises Within the wider community there is no consensus around what sustainability means with some authors identifying 70 to 100 definitions of the term Some see sustainability as the precise and quantifiable outcomes of biological systems whilst others see it in terms of processes relevant to personal and organizational change with the potential to effect changes in our relationships with our environments Internationally it has been increasingly used in relation to the term sustainable development a term popularised by the Brundtland Commission's report in 1987 entitled Our Common Future Despite this diversity and polarised perception on its utility unlike many other popular terms it has not had its time and subsided quietly from our language It is therefore timely for the systems community to explore the relationship between systems and sustainability in a range of contexts Participants in this the 5th International Conference of the United Kingdom Systems Society (UKSS) have been invited to reflect critically on the

contribution of systems thinking and action to sustainability to the sustainability of personal relationships the organizations in which live and work and our natural environment      Advances and New Trends in Environmental Informatics
