## **Snowball Earth:**

*Snowball Earth* Gabrielle Walker, 2007-12-18 Did the Earth once undergo a super ice age one that froze the entire planet from the poles to the equator In *Snowball Earth* gifted writer Gabrielle Walker has crafted an intriguing global adventure story following maverick scientist Paul Hoffman's quest to prove a theory so audacious and profound that it is shaking the world of earth sciences to its core In lyrical prose that brings each remote and alluring locale vividly to life Walker takes us on a thrilling natural history expedition to witness firsthand the supporting evidence Hoffman has pieced together That evidence he argues shows that 700 million years ago the Earth did indeed freeze over completely becoming a giant snowball in the worst climatic catastrophe in history Even more startling is his assertion that instead of ending life on Earth this global deep freeze was the trigger for the Cambrian Explosion the hitherto unexplained moment in geological time when a glorious profusion of complex life forms first emerged from the primordial ooze In a story full of intellectual intrigue we follow the irascible but brilliant Hoffman and a supporting cast of intrepid geologists as they scour the planet uncovering clue after surprising clue We travel to a primeval lagoon at Shark Bay in western Australia where dolphins cavort with swimmers every morning at seven and living rocks sprout out of the water like broccoli heads to the desolate and forbidding ice fields of a tiny Arctic archipelago seven hundred miles north of Norway to the surprising fossil beds that decorate Newfoundland's foggy and windswept coastline and on to the superheated salt pans of California's Death Valley Through the contours of these rich and varied landscapes Walker teaches us to read the traces of geological time with expert eyes and we marvel at the stunning feats of resilience and renewal our remarkable planet is capable of *Snowball Earth* is science writing at its most gripping and enlightening

**Frozen Earth** J. D. Macdougall, 2013-02-15 This is a highly readable account of the nature of ice ages throughout earth's history and the evolution of their scientific understanding since the introduction of the term by Louis Agassiz in the 1830s The shifts in opinion on the merits of the various explanations of ice ages traced by Macdougall make fascinating reading Roger Barry Director National Snow and Ice Data Center *Frozen Earth* is a thorough and compelling account of the history of ice on earth and of the scientists who uncovered the extraordinary role that ice ages have played in shaping our world Gabrielle Walker author of *Snowball Earth* A fascinating and important read Jack Repcheck author of *The Man Who Found Time* Macdougall takes us on a fascinating journey through the realm of ice age science He deciphers some of the basic mysteries of the bitter climatic regimes that have gripped the earth in the past and will probably grip it again in the future This engrossing book has important lessons for anyone concerned with global warming and future climatic change Brian Fagan author of *The Little Ice Age*

The second edition of this acclaimed text has been fully updated and substantially expanded to include the considerable developments since publication of the first edition in our understanding of the science of climate change its impacts on biological and human systems and developments in climate policy Written in an accessible style it provides a broad review of past present and likely future climate change from the viewpoints of biology ecology human ecology and Earth system science It will again prove to be invaluable to a wide range of readers from students in the life sciences who need a brief overview of the basics of climate science to atmospheric science geography geoscience and environmental science students who need to understand the biological and human ecological implications of climate change It is also a valuable reference text for those involved in environmental monitoring conservation and policy making      Rare Earth Peter D. Ward, Donald Brownlee, 2007-05-08

In November 12 2002 Dr John Chambers of the NASA Ames Research Center gave a seminar to the Astrobiology Group at the University of Washington The audience of about 100 listened with rapt attention as Chambers described results from a computer study of how planetary systems form The goal of his research was to answer a deceptively simple question How often would newly forming planetary systems produce Earth like planets given a star the size of our own sun By Earth like Chambers meant a rocky planet with water on its surface orbiting within a star's habitable zone This not too hot and not too cold inner region relatively close to the star supports the presence of liquid water on a planet surface for hundreds of millions of years the time span probably necessary for the evolution of life To answer the question of just how many Earth like planets might be spawned in such a planetary system Chambers had spent thousands of hours running highly sophisticated modeling programs through arrays of powerful computers The results presented at the meeting were startling The simulations showed that rocky planets orbiting at the right distances from the central star are easily formed but they can end up with a wide range of water content Earth seems to be quite a gem a rocky planet where not only can liquid water exist for long periods of time but where water can be found as a healthy ocean not too little and not too much Our planet seems to reside in a benign region of the Galaxy where comet and asteroid bombardment is tolerable and habitable zone planets can commonly grow to Earth size Such real estate in our galaxy perhaps in any galaxy is prime for life And rare as well      *Encyclopedia of Geology*, 2020-12-16

*Encyclopedia of Geology* Second Edition presents in six volumes state of the art reviews on the various aspects of geologic research all of which have moved on considerably since the writing of the first edition New areas of discussion include extinctions origins of life plate tectonics and its influence

components of the planet. Organisms have progressively occupied all the habitats of the planet, diversifying into countless life forms and developing enormous biomasses over the past 3.6 billion years. In this way, organisms and ecosystems took over the Earth System and thus became major agents in its regulation and global evolution. There was co-evolution of the different components of the Earth System, leading to a number of feedback mechanisms that regulated long-term Earth conditions. For millennia, and especially since the Industrial Revolution nearly 300 years ago, humans have gradually transformed the Earth System. Technological developments combined with the large increase in human population have led in recent decades to major changes in the Earth's climate, soils, biodiversity, and quality of air and water. After some successes in the 20th century at preventing internationally environmental disasters, human societies are now facing major challenges arising from climate change. Some of these challenges are short-term, and others concern the thousand-year evolution of the Earth's climate. Humans should become the stewards of Earth.

**Our Magnetic Earth** Ronald T. Merrill, 2011-01-15 For the general public, magnetism often seems more the province of new-age quacks, movie mad scientists, and grade school teachers than an area of actual ongoing scientific inquiry. But as Ronald T. Merrill reveals in *Our Magnetic Earth*, geomagnetism really is an enduring, vibrant area of science, one that offers answers to some of the biggest questions about our planet's past and maybe even its future. In a clear and careful fashion, he lays out the physics of geomagnetism and magnetic fields, then goes on to explain how Earth's magnetic field provides crucial evidence for our understanding of continental drift and plate tectonics, how and why animals ranging from bacteria to mammals sense and use the magnetic field, how changes in climate over eons can be studied through variations in the magnetic field in rocks, and much more. Throughout, Merrill peppers his scientific account with bizarre anecdotes and fascinating details, from levitating pizzas to Moon missions to blackmailing KGB agents, a reminder that real science can at times be stranger and more amusing than fiction. A winning primer for anyone who has ever struggled with a compass or admired a ragged V of migrating geese, *Our Magnetic Earth* demonstrates that education and entertainment need not be polar opposites.

**Making Prehistory** Derek Turner, 2007-07-05 Scientists often make surprising claims about things that no one can observe. In physics, chemistry, and molecular biology, scientists can at least experiment on those unobservable entities, but what about researchers in fields such as paleobiology and geology, who study prehistory where no such experimentation is possible? Do scientists discover facts about the distant past, or do they in some sense make prehistory? In this book, Derek Turner argues that this problem has surprising and important consequences for the scientific realism debate. His discussion covers some of the main positions in philosophy of science: realism, social constructivism, empiricism, and the natural ontological attitude, and shows how they relate to issues in paleobiology and geology. His original and thought-provoking book will be of wide interest to philosophers and scientists alike.
