Stochastic Processes in Information and Dynamical Systems Eugene Wong, 1979 **Stochastic Processes in Dynamics** B. Skalmierski, A. Tylikowski, 1982-11-30 *Chaotic Transitions in Deterministic and Stochastic Dynamical Systems* Emil Simiu, 2002 This text develops a unified treatment of deterministic and stochastic systems that extends the Melnikov method to physically realisable stochastic planar systems *Stochastic Processes in Information and Dynamical Systems* Wai Leong Wong, 1971 *Stochastic Dynamical Systems* J. Honerkamp, 1994 **Analysis and Data-Based Reconstruction of Complex Nonlinear Dynamical Systems** M. Reza Rahimi Tabar, 2019 This book focuses on a central question in the field of complex systems Given a fluctuating in time or space uni or multi variant sequentially measured set of experimental data even noisy data how should one analyse non parametrically the data assess underlying trends uncover characteristics of the fluctuations including diffusion and jump contributions and construct a stochastic evolution equation Here the term non parametrically exemplifies that all the functions and parameters of the constructed stochastic evolution equation can be determined directly from the measured data The book provides an overview of methods that have been developed for the analysis of fluctuating time series and of spatially disordered structures Thanks to its feasibility and simplicity it has been successfully applied to fluctuating time series and spatially disordered structures of complex systems studied in scientific fields such as physics astrophysics meteorology earth science engineering finance medicine and the neurosciences and has led to a number of important results The book also includes the numerical and analytical approaches to the analyses of complex time series that are most common in the physical and natural sciences Further it is self contained and readily accessible to students scientists and researchers who are familiar with traditional methods of mathematics such as ordinary and partial differential equations The codes for analysing continuous time series are available in an R package developed by the research group Turbulence Wind energy and Stochastic TWiSt at the Carl von Ossietzky University of Oldenburg under the supervision of Prof Dr Joachim Peinke This package makes it possible to extract the stochastic evolution equation underlying a set of data or measurements **Decision Processes in Dynamic Probabilistic Systems** A.V. Dynamical Systems Nikolai Nikolaevich Bogoliubov, 1977 Hidden Markov Models and Dynamical Systems Andrew M. Fraser, 2008-01-01 Presents algorithms for using HMMs and explains the derivation of those algorithms for the dynamical systems community *Hyperbolic Dynamics, Fluctuations and Large Deviations* D. Dolgopyat, Y. Pesin, M. Pollicott, L. Stoyanov, 2015-04-01 This volume contains the proceedings of the semester long special program on Hyperbolic Dynamics Large Deviations and Fluctuations which was held from January to June 2013 at the Centre Interfacultaire Bernoulli of the Polytechnique Fédérale de Lausanne Switzerland The broad theme of the program was the long term behavior of dynamical systems and their statistical behavior During the last 50 years the statistical properties of dynamical systems of many different types have been the subject of extensive study in statistical mechanics and thermodynamics ergodic and probability theories and some areas of mathematical physics The results of this study have had a profound effect on many different areas in mathematics physics engineering and biology The papers in this volume cover topics in large deviations and thermodynamics formalism and limit theorems for dynamic systems The material presented is primarily directed at researchers and graduate students in the very broad area of dynamical systems and ergodic theory but will also be of interest to researchers in related areas such as statistical physics spectral theory and some aspects of number theory and geometry

Physiological Noise and Informative Randomness in Neural and Cardiovascular Systems Andrea Scarciglia, Claudio Bonanno, Gaetano Valenza, 2025-09-21 Noise often viewed as a disturbance in biomedical signal analysis plays a crucial and informative role in the dynamics of complex physiological systems particularly in neurocardiovascular and neural networks Recent developments underscore noise or stochasticity as fundamental to physiological processes from information transfer in the nervous system across scales from neurons to the brain to cardiovascular respiratory motor and sensory functions This book offers readers a comprehensive perspective on physiological noise redefining it not as an artifact as traditionally viewed but as an inherent component of physiological systems It explores noise phenomenology within the neuro cardiovascular system across multiple scales and presents the primary mathematical methods for estimating intrinsic noise Building on foundational approaches the book introduces recent noise estimation techniques and details the validation of these stochastic component estimates using synthetic data and their applications to real physiological systems The methods ultimately position noise as a promising biomarker for differentiating between various physiological pathologic states This book is designed for undergraduate and master's students as well as PhD students and researchers in biomedical engineering and physiology Its broad appeal stems from the subject's multidisciplinary nature and the structured progression of concepts which helps readers build a strong foundation for understanding the key methods presented Readers will be guided through a rigorous formal exploration of essential tools making analyses and results accessible Illustrative figures and informal explanations of core concepts are included to enhance intuitive understanding **Scientific and Technical Aerospace Reports**, 1989

Identification and System Parameter Estimation 1982 G. A. Bekey, G. N. Saridis, 2016-06-06 Identification and System Parameter Estimation 1982 covers the proceedings of the Sixth International Federation of Automatic Control IFAC Symposium The book also serves as a tribute to Dr Naum S Rajbman The text covers issues concerning identification and estimation such as increasing interrelationships between identification estimation and other aspects of system theory including control theory signal processing experimental design numerical mathematics pattern recognition and information theory The book also provides coverage regarding the application and problems faced by several engineering and scientific fields that use identification and estimation such as biological systems traffic control geophysics aeronautics robotics economics and power systems Researchers from all scientific fields will find this book a great reference material since it presents topics that concern various disciplines

Fault Detection, Supervision and Safety of Technical Processes 2003 (SAFEPROCESS 2003) Marcel Staroswiecki, Eva Wu, 2004-02-27 A three volume work bringing together papers presented at SAFEPROCESS 2003 including four plenary papers on statistical physical model based and logical model based approaches to fault detection and diagnosis as well as 178 regular papers

Diagnosis and Fault-Tolerant Control Mogens Blanke, Michel Kinnaert, Jan Lunze, Marcel Staroswiecki, 2006-09-24 Fault tolerant control aims at a graceful degradation of the behaviour of automated systems in case of faults It satisfies the industrial demand for enhanced availability and safety in contrast to traditional reactions to faults that bring about sudden shutdowns and loss of availability The book presents effective model based analysis and design methods for fault diagnosis and fault tolerant control Architectural and structural models are used to analyse the propagation of the fault through the process to test the fault detectability and to find the redundancies in the process that can be used to ensure fault tolerance Design methods for diagnostic systems and fault tolerant controllers are presented for processes that are described by analytical models by discrete event models or that can be dealt with as quantised systems Five case studies on pilot processes show the applicability of the presented methods The theoretical results are illustrated by two running examples used throughout the book The second edition includes new material about reconfigurable control diagnosis of nonlinear systems and remote

diagnosis The application examples are extended by a steering by wire system and the air path of a diesel engine both of which include experimental results The bibliographical notes at the end of all chapters have been up dated The chapters end with exercises to be used in lectures

Local Limit Theorems for Inhomogeneous Markov Chains Dmitry Dolgopyat, Omri M. Sarig, 2023-07-31 This book extends the local central limit theorem to Markov chains whose state spaces and transition probabilities are allowed to change in time Such chains are used to model Markovian systems depending on external time dependent parameters The book develops a new general theory of local limit theorems for additive functionals of Markov chains in the regimes of local moderate and large deviations and provides nearly optimal conditions for the classical expansions as well as asymptotic corrections when these conditions fail Applications include local limit theorems for independent but not identically distributed random variables Markov chains in random environments and time dependent perturbations of homogeneous Markov chains The inclusion of appendices with background material numerous examples and an account of the historical background of the subject make this self contained book accessible to graduate students It will also be useful for researchers in probability and ergodic theory who are interested in asymptotic behaviors Markov chains in random environments random dynamical systems and non stationary systems

System-Theoretic Methods in Economic Modelling I S. Mittnik, 2014-06-28 The value of applying system theoretic concepts to economic modelling problems arises from the fact that it offers a unifying framework for modelling dynamic systems In addition to offering this powerful conceptual framework it provides a wide range of tools useful in applied work System theoretic techniques enter predominantly two stages of economic modelling efforts the stage of model construction and the stage of model application in accordance with the modelling The objective of this and subsequent volumes on System Theoretic Methods in Economic Modelling I is to initiate and or intensify dialogues between researchers and practitioners within and across the disciplines involved This first volume brings together papers exhibiting a wide range of system theoretic techniques and applications to economic problems The papers have been divided into two groups following roughly but not necessarily the above classification into the construction and application stages of economic modelling The papers in the first group focus on the identification of dynamic and static systems while the papers in the second group address dynamic optimization problems
