*Stochastic Project Networks* Klaus Neumann, 1990-07-10 Project planning scheduling and control are regularly used in business and the service sector of an economy to accomplish outcomes with limited resources under critical time constraints To aid in solving these problems network based planning methods have been developed that now exist in a wide variety of forms cf Elmaghraby 1977 and Moder et al 1983 The so called classical project networks which are used in the network techniques CPM and PERT and which represent acyclic weighted directed graphs are able to describe only projects whose evolution in time is uniquely specified in advance Here every event of the project is realized exactly once during a single project execution and it is not possible to return to activities previously carried out that is no feedback is permitted Many practical projects however do not meet those conditions Consider for example a production process where some parts produced by a machine may be poorly manufactured If an inspection shows that a part does not conform to certain specifications it must be repaired or replaced by a new item This means that we have to return to a preceding stage of the production process In other words there is feedback Note that the result of the inspection is that a certain percentage of the parts tested do not conform That is there is a positive probability strictly less than 1 that any part is defective

**Optimization of Temporal Networks under Uncertainty** Wolfram Wiesemann, 2012-01-04 Many decision problems in Operations Research are defined on temporal networks that is workflows of time consuming tasks whose processing order is constrained by precedence relations For example temporal networks are used to model projects computer applications digital circuits and production processes Optimization problems arise in temporal networks when a decision maker wishes to determine a temporal arrangement of the tasks and or a resource assignment that optimizes some network characteristic e g the time required to complete all tasks The parameters of these optimization problems e g the task durations are typically unknown at the time the decision problem arises This monograph investigates solution techniques for optimization problems in temporal networks that explicitly account for this parameter uncertainty We study several formulations each of which requires different information about the uncertain problem parameters *Perspectives on Operations Research* Martin Morlock, Christoph Schwindt, Norbert Trautmann, Jürgen Zimmermann, 2007-10-31 This collection of essays is dedicated to Professor Klaus Neumann Head and Chair of the Institute for Economic Theory and Operations Research WiOR at the University of Karlsruhe On the occasion of his emeritation disciples colleagues scientific companions and friends coming from different fields have contributed their perspectives on Operations Research to form a broad view on the discipline The papers are organized in four parts on optimization OR in production and service management OR in logistics and interdisciplinary approaches We thank all the authors for their participation in publishing this volume Mrs Ute Wrasmann from Deutscher Universitäts Verlag deserves credit for her interest and assistance on this project Finally we would like to express our gratitude to PTV Planung Transport Verkehr AG in Karlsruhe and to numerous former WiOR colleagues for their

financial support Klaus Neumann was born in Liegnitz Silesia in 1937 From 1955 to 1961 he studied mathematics at the Technical Universities of Dresden and Munich His first paper on analog computers and dynamic programming was published less than two years later In 1964 he obtained a Ph D in mathematics under the supervision of Josef Heinhold in Munich After a two year stay in industry he returned to his alma mater working on the fields of dynamic optimization and control theory

**Scheduling of Resource-Constrained Projects** Robert Klein, 2012-12-06 Project management has become a

widespread instrument enabling organizations to efficiently master the challenges of steadily shortening product life cycles global markets and decreasing profit margins With projects increasing in size and complexity their planning and control represents one of the most crucial management tasks This is especially true for scheduling which is concerned with establishing execution dates for the sub activities to be performed in order to complete the project The ability to manage projects where resources must be allocated between concurrent projects or even sub activities of a single project requires the use of commercial project management software packages However the results yielded by the solution procedures included are often rather unsatisfactory Scheduling of Resource Constrained Projects develops more efficient procedures which can easily be integrated into software packages by incorporated programming languages and thus should be of great interest for practitioners as well as scientists working in the field of project management The book is divided into two parts In Part I the project management process is described and the management tasks to be accomplished during project planning and control are discussed This allows for identifying the major scheduling problems arising in the planning process among which the resource constrained project scheduling problem is the most important Part II deals with efficient computer based procedures for the resource constrained project scheduling problem and its generalized version Since both problems are NP hard the development of such procedures which yield satisfactory solutions in a reasonable amount of computation time is very challenging and a number of new and very promising approaches are introduced This includes heuristic procedures based on priority rules and tabu search as well as lower bound methods and branch and bound procedures which can be applied for computing optimal solutions

Managing the Dynamics of New Product Development Processes Arie Karniel, Yoram Reich, 2011-07-28

Managing the Dynamics of New Product Development Processes merges product based planning process modelling process execution probabilistic simulations and simulation based decision making into one framework called the Dynamic new Product Development Process It provides readers with a means of improving the management of product development through enhanced methods and tools that are specifically tailored to the characteristics and challenges of such processes It calls for a new Product Lifecycle Management paradigm of utilizing the managed product data for management of the product s development process Within the framework the methods used are enhanced or modified to fit the new product development process requirements Each specific method is exhaustively analyzed from the basic definition of terms through a description of the state of the art of that topic and its limitations Then the method enhancements are illustrated by many examples and discussed while suggesting further research directions Finally the enhanced methods are integrated and demonstrated by a test case The main two methods described are the design structure matrix DSM and Petri nets which are merged into a novel concept entitled DSM nets Managing the Dynamics of New Product Development Processes provides algorithms proofs and practical examples that can be used for general study of the issues concerned The main concepts presented are applicable to systems engineering and can be used by practitioners of product

development processes such as designers product managers and process managers as well as developers of process management tools for systems with dynamically changing process structures

**Project Scheduling under Limited Resources** Sönke Hartmann, 2012-12-06 Approaches to project scheduling under resource constraints are discussed in this book After an overview of different models it deals with exact and heuristic scheduling algorithms The focus is on the development of new algorithms Computational experiments demonstrate the efficiency of the new heuristics Finally it is shown how the models and methods discussed here can be applied to projects in research and development as well as market research

Principles and Practice of Constraint Programming - CP 2010 David Cohen,2010-08-30 The 16th annual International Conference on the Principles and Practice of Constraint Programming CP 2010 was held in St Andrews Scotland during September 6 10 2010 We would like to thank our sponsors for their generous support of this event This conference is concerned with all aspects of computing with constraints including theory algorithms applications environments languages models and systems We received a wide variety of submissions each of which was reviewed by at least three referees Referees were chosen for each submission by an initial bidding process where Program Committee members chose papers

from their area of interest. The range of expertise represented by the large Program Committee meant that almost all submissions were reviewed by subject experts on the Program Committee or by colleagues chosen by members of the Program Committee for their particular expertise. Papers were solicited either as long 15 page or short 8 page submissions. Short paper submissions were refereed to exactly the same high standards as long paper submissions but naturally were expected to contain a smaller quantity of new material. Thus there is no distinction in these proceedings between short and long papers. I used the excellent EasyChair conference management system to support this process of reviewing and for the collation and organization of these proceedings. Submissions were made either to the applications track or to the research track. There were 101 23 short research track submissions of which 36 8 short were accepted which is a 36% 35% of short acceptance rate. Application track submissions received special consideration and the acceptance rate was significantly higher than for the research track.
