Stochastic Models with Applications to Genetics, Cancers, AIDS and Other Biomedical Systems W. Y. Tan, 2002 This book presents a systematic treatment of Markov chains diffusion processes and state space models as well as alternative approaches to Markov chains through stochastic difference equations and stochastic differential equations It illustrates how these processes and approaches are applied to many problems in genetics carcinogenesis AIDS epidemiology and other biomedical systems One feature of the book is that it describes the basic MCMC Markov chain and Monte Carlo procedures and illustrates how to use the Gibbs sampling method and the multilevel Gibbs sampling method to solve many problems in genetics carcinogenesis AIDS and other biomedical systems As another feature the book develops many state space models for many genetic problems carcinogenesis AIDS epidemiology and HIV pathogenesis It shows in detail how to use the multilevel Gibbs sampling method to estimate or predict simultaneously the state variables and the unknown parameters in cancer chemotherapy carcinogenesis AIDS epidemiology and HIV pathogenesis As a matter of fact this book is the first to develop many state space models for many genetic problems carcinogenesis and other biomedical problems

Stochastic Models With Applications To Genetics, Cancers, Aids And Other Biomedical Systems (Second Edition)

Wai-yuan Tan, 2015-10-28 This book presents a systematic treatment of Markov chains diffusion processes and state space models as well as alternative approaches to Markov chains through stochastic difference equations and stochastic differential equations It illustrates how these processes and approaches are applied to many problems in genetics carcinogenesis AIDS epidemiology and other biomedical systems One feature of the book is that it describes the basic MCMC Markov chain and Monte Carlo procedures and illustrates how to use the Gibbs sampling method and the multilevel Gibbs sampling method to solve many problems in genetics carcinogenesis AIDS and other biomedical systems As another feature the book develops many state space models for many genetic problems carcinogenesis AIDS epidemiology and HIV pathogenesis It shows in detail how to use the multilevel Gibbs sampling method to estimate or predict simultaneously the state variables and the unknown parameters in cancer chemotherapy carcinogenesis AIDS epidemiology and HIV pathogenesis As a matter of fact this book is the first to develop several state space models for many genetic problems carcinogenesis and other biomedical problems To emphasize special applications to medical problems in this new edition the book has added a new chapter to illustrate how to develop biologically supported stochastic models and state space models of carcinogenesis in human beings Specific examples include hidden Markov models and state space models for human colon cancer human liver cancer and some human pediatric cancers such as retinoblastoma and hepatoblastoma The book also gives examples to illustrate how to develop procedures to assess cancer risk of environmental agents through initiation promotion protocols

Quantitative Methods for Investigating Infectious Disease Outbreaks Ping Yan, Gerardo Chowell, 2019-08-16 This book provides a systematic treatment of the mathematical underpinnings of work in the theory of outbreak dynamics and their control covering balanced perspectives between theory and practice including new material on contemporary topics in the field of infectious disease modelling Specifically it presents a unified mathematical framework linked to the distribution theory of non negative random variables the many examples used in the text are introduced and discussed in light of theoretical perspectives The book is organized into 9 chapters The first motivates the presentation of the material on subsequent chapters Chapter 2 3 provides a review of basic concepts of probability and statistical models for the distributions of continuous lifetime data and the distributions of random counts and counting processes which are linked to phenomenological models Chapters 4 focuses on dynamic behaviors of a disease outbreak during the initial phase while Chapters 5 6 broadly cover compartment models to investigate the consequences of epidemics as the outbreak moves beyond the initial phase Chapter 7 provides a transition between mostly theoretical topics in earlier chapters and Chapters 8 and 9 where the focus is on the data generating processes and statistical issues of fitting models to data as well as specific mathematical epidemic modeling applications respectively This book is aimed at a wide audience ranging from graduate students to established scientists from quantitatively oriented fields of epidemiology mathematics and statistics The

numerous examples and illustrations make understanding of the mathematics of disease transmission and control accessible Furthermore the examples and exercises make the book suitable for motivated students in applied mathematics either through a lecture course or through self study This text could be used in graduate schools or special summer schools covering research problems in mathematical biology

Mapping AIDS Lukas Engelmann,2018-11-08 In this innovative study Lukas Engelmann examines visual traditions in modern medical history through debates about the causes impact and spread of AIDS Utilising medical AIDS atlases produced between 1986 and 2008 for a global audience Engelmann argues that these visual textbooks played a significant part in the establishment of AIDS as a medical phenomenon However the visualisations risked obscuring the social cultural and political complexity of AIDS history Photographs of patients were among the earliest responses to the mysterious syndrome cropped and framed to deliver a visible characterisation of AIDS to a medical audience Maps then offered an abstracted image of the regions

invaded by the epidemic while the icon of the virus aspired to capture the essence of AIDS The epidemic's history is retold through clinical photographs epidemiological maps and icons of HIV asking how this devastating epidemic has come to be seen as a controllable chronic condition Mathematics in Population Biology Horst R. Thieme, 2018-06-05 The formulation analysis and re evaluation of mathematical models in population biology has become a valuable source of insight to mathematicians and biologists alike This book presents an overview and selected sample of these results and ideas organized by biological theme rather than mathematical concept with an emphasis on helping the reader develop appropriate modeling skills through use of well chosen and varied examples Part I starts with unstructured single species population models particularly in the framework of continuous time models then adding the most rudimentary stage structure with variable stage duration The theme of stage structure in an age dependent context is developed in Part II covering demographic concepts such as life expectation and variance of life length and their dynamic consequences In Part III the author considers the dynamic interplay of host and parasite populations i e the epidemics and endemics of infectious diseases The theme of stage structure continues here in the analysis of different stages of infection and of age structure that is instrumental in optimizing vaccination strategies Each section concludes with exercises some with solutions and suggestions for further study The level of mathematics is relatively modest a toolbox provides a summary of required results in differential equations integration and integral equations In addition a selection of Maple worksheets is provided The book provides an authoritative tour through a dazzling ensemble of topics and is both an ideal introduction to the subject and reference for researchers
