Himalayan Quality of Life Benjamin L. Saitluanga, 2017-04-18 The book is a study of intra urban inequality in quality of life QOL in Aizawl city The main objectives of the study include analysis of processes and patterns of social differentiation along the three dimensional space of Aizawl city as well as analysis of spatial inequality in QOL at the lowest administrative structure of the city An investigation into spatial pattern of residential differentiation was done at both horizontal and vertical spaces Spatial variation in well being of residents of Aizawl city and the quality of their immediate environment was also studied by taking both objective and subjective indicators The study employed a number of descriptive inferential and multivariate statistical techniques including correlation factor analysis principal component analysis cluster analysis and spatial autocorrelation methods like Moran's  $I$  and Local Indicators of Spatial Association LISA Mapping techniques and graphical methods like Choropleth map histogram and line graph were also used With the help of factor analysis the social space of Aizawl city was found to be differentiated along socio economic status family status household size status workers status and ethnic status The most important factor determining residential differentiation was socio economic status Choropleth map of factor scores reveals that the inner city localities were dominated by high socio economic class while poorer people dominated the peripheries Non local ethnic minorities were few but concentrated in some adjoining peripheral localities as well as in inner city localities which have been inhabited by their ancestors since the colonial period Vertical pattern of residential differentiation was also analyzed by taking income variable as a proxy of socio economic status Multi storey buildings in Aizawl city were co inhabited by both richer people and poorer people The richer people were found at the top floors while the poorer people occupied the basement floors Normally the owners of the buildings were found at the top floors while the basement floors were dominated by the renters Spatial variation in QOL was measured with the help of principal component analysis as a weighting technique by taking variables pertaining to both objective and subjective QOL dimensions The values of composite QOL index showed that the central localities have scored better than their peripheral counterparts Correlation analysis of the relationship between objective indicators and subjective indicators provided a low positive value indicating the absence of relationship between the two dimensions of quality of life Spatial autocorrelation

analysis was also performed to see the pattern of clustering of spatially weighted QOL variables across Local Councils. With the help of Global Moran's I, spatial clusters and spatial outliers were observed for objective dimension of QOL within the study area. The value of Moran's I was found to be insignificant for subjective QOL dimension, indicating the absence of significant pattern of clustering. The study also identified 7 social areas of Aizawl city on the basis of factor scores and composite scores of QOL variables calculated for all Local Councils. The identification of clusters was taken out with the help of hierarchical clustering method of cluster analysis. These clusters were labeled appropriate names and their characteristics were described in detail. The thesis concluded with recommendation of designating these social areas as social development planning zones for obtaining inclusive development.

The application studies cover various fields such as agriculture, climate, energy, industry, business, social, and so on. The conference is expected to be able to provide solutions to various problems in various fields through statistical and analytical approaches.

**Aggregating Dialectology, Typology, and Register Analysis** Benedikt Szmrecsanyi, Bernhard Wälchli, 2014-08-22. This volume aims to overcome subdisciplinary boundaries in the study of linguistic variation, be it language internal or cross-linguistic. Even though dialectologists, register analysts, typologists, and quantitative linguists all deal with linguistic variation, there is astonishingly little interaction across these fields. But the fourteen contributions in this volume show that these subdisciplines actually share many interests and methodological concerns in common. The chapters specifically converge in the following ways: First, they all seek to explore linguistic variation within or across languages. Second, they are based on usage data that is on corpora of more or less authentic text or speech of different languages or language varieties. Third, all chapters are concerned with the joint analysis, also sometimes known as aggregation or data synthesis, of multiple phenomena, features, or measurements of some sort. And lastly, the contributors all marshal quantitative analysis techniques to analyse the data. In short, the volume explores the text feature aggregation pipeline in variation studies, demonstrating that there is much mutual inspiration to be had by thinking outside the disciplinary box.
