Dispersal, Individual Movement and Spatial Ecology Mark A. Lewis, Philip K. Maini, Sergei V. Petrovskii, 2013-03-21 Dispersal of plants and animals is one of the most fascinating subjects in ecology It has long been recognized as an important factor affecting ecosystem dynamics Dispersal is apparently a phenomenon of biological origin however because of its complexity it cannot be studied comprehensively by biological methods alone Deeper insights into dispersal properties and implications require interdisciplinary approaches involving biologists ecologists and mathematicians The purpose of this book is to provide a forum for researches with different backgrounds and expertise and to ensure further advances in the study of dispersal and spatial ecology This book is unique in its attempt to give an overview of dispersal studies across different spatial scales such as the scale of individual movement the population scale and the scale of communities and ecosystems It is written by top level experts in the field of dispersal modeling and covers a wide range of problems ranging from the identification of Levy walks in animal movement to the implications of dispersal on an evolutionary timescale **Theory of the Spread of Epidemics and Movement Ecology of Animals** V. Spatial Simulation David O'Sullivan, George L. W. Perry, 2013-09-10 A ground up approach to explaining dynamic spatial modelling for an interdisciplinary audience Across broad areas of the environmental and social sciences simulation models are an important way to study systems inaccessible to scientific experimental and observational methods and also an essential complement to those more conventional approaches The contemporary research literature is teeming with abstract simulation models whose presentation is mathematically demanding and requires a high level of knowledge of quantitative and computational methods and approaches Furthermore simulation models designed to represent specific systems and phenomena are often complicated and as a result difficult to reconstruct from their descriptions in the literature This book aims to provide a practical and accessible account of dynamic spatial modelling while also equipping readers with a sound conceptual foundation in the subject and a useful introduction to the wide ranging literature Spatial Simulation Exploring Pattern and Process is organised around the idea that a small number of spatial processes underlie the wide variety of dynamic spatial models Its central focus on three building blocks of dynamic spatial models forces of attraction and segregation individual mobile entities and processes of spread guides the reader to an understanding of the basis of many of the complicated models found in the research literature The three building block models are presented in their simplest form and are progressively elaborated and related to real world process that can be represented using them Introductory chapters cover essential background topics particularly the relationships between pattern process and spatiotemporal scale Additional chapters consider how time and space can be represented in more complicated models and methods for the analysis and evaluation of models Finally the three building block models are woven together in a more elaborate example to show how a

complicated model can be assembled from relatively simple components To aid understanding more than 50 specific models described in the book are available online at patternandprocess.org for exploration in the freely available Netlogo platform This book encourages readers to develop intuition for the abstract types of model that are likely to be appropriate for application in any specific context Spatial Simulation Exploring Pattern and Process will be of interest to undergraduate and graduate students taking courses in environmental social ecological and geographical disciplines Researchers and professionals who require a non specialist introduction will also find this book an invaluable guide to dynamic spatial simulation
