Piscitelli, Keith

Rodvold, 2007-10-28 Over the past 25 years the world s population has witnessed an explosion in knowledge about infectious diseases The global population is coming to the realization that diseases long recognized to cause substantial suffering such as malaria tuberculosis schistosomiasis and hepatitis can be diagnosed and treated and that transmission can be prevented using tools that are available and which may be becoming increasingly affordable The global population is recognizing that few infections are local the travel of humans other animals insects and food transport pathogens around the world often with astonishing rapidity New pathogens are appearing either newly recognized or newly developing such as severe acute respiratory syndrome SARS avian influenza metapneumovirus or hepatitis C which are causing human morbidity and mortality Finally there is growing fear that dangerous pathogens may be intentionally introduced into human populations by deranged individuals or terrorist organizations The potential to use drugs or biologic agents to treat and prevent infectious diseases has increased dramatically over the past quarter century as we have learned more about the biology of many of these agents and as we have developed techniques to discover new agents by high throughput screening programs and by sophisticated drug design and synthesis **Handbook of Drug-Nutrient Interactions** Joseph I. Boullata, Vincent T. Armenti, 2004-04-17

Although there is a great deal of literature regarding drug-nutrient interactions DNI s there are limited sources of up to date comprehensive information The Handbook of Drug-Nutrient Interactions admirably fills this gap The editors Dr Joseph I Boullata and Dr Vincent T Armenti have a wealth of experience in this therapeutic area and have assembled a fine cadre of chapter authors who have individually contributed their high level of expertise As treatment for many diseases becomes increasingly complex with multiple drug therapies scheduled at varying times the need to identify clinically significant DNI s is an essential part of medication management This is a shared responsibility between health care professionals to interpret available data and individualize an approach to therapy that is compatible with the patient s disease state life stage and dietary intake Awareness of the significance of drug-food interactions is generally lacking Although many texts contain lengthy lists of possible interactions few data are provided for the clinician to gain an understanding of the mechanism of action of the interaction and subsequently apply the information to a particular patient or group of patients For example in the management of patients with HIV/AIDS who are taking complex prescribed drug regimens herbal products and nutritional supplements many of which are affected by dietary intake careful attention to DNI s is a critical component of therapy Clinicians need to take account of not only the well documented interactions between drugs and nutrients but also the less obvious effects on drug-nutrient disposition and metabolism Standard Treatment Guidelines—A Manual for Medical
