Optical Approaches to Capture Plant Dynamics in Time, Space, and Across Scales Eetu Puttonen, Norbert Pfeifer, Alexander Bucksch, András Zlinszky, 2018-08-17 Quantifying temporal changes in plant geometry as a result of genetic developmental or environmental causes is essential to improve our understanding of the structure and function relationships in plants Over the last decades optical imaging and remote sensing developed fundamental working tools to monitor and quantify our environment and plants in particular Increased efficiency of methods lowered the barrier to compare integrate and interpret the optically obtained plant data across larger spatial scales and across scales of biological organization In particular acquisition speed at high resolutions reached levels that allow capturing the temporal dynamics in plants in three dimensions along with multi spectral information beyond human visual senses These advanced imaging capabilities have proven to be essential to detect and focus on analyzing temporal dynamics of plant geometries The focus of this Research Topic is on optical techniques developed to study geometrical changes at the plant level detected within the wavelength spectrum between near UV to near infrared Such techniques typically involve photogrammetric LiDAR or imaging spectroscopy approaches but are not exclusively restricted to these Instruments operating within this range of wavelengths allow capturing a wide range of temporal scales ranging from sub second to seasonal changes that result from plant development environmental effects like wind and heat or genetically controlled adaption to environmental conditions The Research Topic covered a plethora of methodological approaches as suggestions for best practices in the light of a particular research question and to a wider view to different research disciplines and how they utilize their state of the art techniques in demonstrating potential use cases across different scales

Fuzzy Modeling with Spatial Information for Geographic Problems Frederick E. Petry, Vincent B. Robinson, Maria A. Cobb, 2006-01-16 The capabilities of modern technology are rapidly increasing spurred on to a large extent by the tremendous advances in communications and computing Automated vehicles and global wireless connections are some examples of these advances In order to take advantage of such enhanced capabilities our need to model and manipulate our knowledge of the geophysical world using compatible representations is also rapidly increasing In response to this one fundamental issue of great concern in modern geographical research is how to most effectively capture the physical world around us in systems like geographical information systems GIS Making this task even more challenging is the fact that uncertainty plays a pervasive role in the representation analysis and use of geospatial information The types of uncertainty that appear in geospatial information systems are not the just simple randomness of observation as in weather data but are manifested in many other forms including imprecision incompleteness and granularization Describing the uncertainty of the boundaries of deserts and mountains clearly require different tools than those provided by probability theory The multiplicity of modalities of

uncertainty appearing in GIS requires a variety of formalisms to model these uncertainties In light of this it is natural that fuzzy set theory has become a topic of intensive interest in many areas of geographical research and applications This volume Fuzzy Modeling with Spatial Information for Geographic Problems provides many stimulating examples of advances in geographical research based on approaches using fuzzy sets and related technologies Computational Modelling of Objects Represented in Images III Paolo Di Giamberardino, Daniela Iacoviello, João Manuel R.S. Spatial Language and Dialogue Kenny R. Coventry, Thora Tenbrink, John Bateman, 2009-04-23 This book considers how people talk about the location of objects and places Spatial language has occupied many researchers across diverse fields such as linguistics psychology GIScience architecture and neuroscience However the vast majority of work in this area has examined spatial language in monologue situations and often in highly artificial and restricted settings Yet there is a growing recognition in the language research community that dialogue rather than monologue should be a starting point for language understanding Hence the current zeitgeist in both language research and robotics AI demands an integrated examination of spatial language in dialogue settings The present volume provides such integration for the first time and reports on the latest developments in this important field Written in a way that will appeal to researchers across disciplines from graduate level upwards the book sets the agenda for future research in spatial conceptualization and communication
