course of 10 days from the Hubble Space Telescope and has prompted astronomers and other scientists to speculate about universe's size, shape and age. How long ago did the first galaxies appear? Have they always looked like they do today or have their shapes evolved over time? And will they along with the universe itself go on expanding forever? The Hubble Deep Field has helped to answer some of these questions.

**A Feature-Centric View of Information Retrieval** Donald Metzler, 2011-09-18. Commercial Web search engines such as Google, Yahoo and Bing are used every day by millions of people across the globe. With their ever growing refinement and usage, it has become increasingly difficult for academic researchers to keep up with the collection sizes and other critical research issues related to Web search, which has created a divide between the information retrieval research being done within academia and industry. Such large collections pose a new set of challenges for information retrieval researchers. In this work, Metzler describes highly effective information retrieval models for both smaller classical data sets and larger Web collections. In a shift away from heuristic hand-tuned ranking functions and complex probabilistic models, he presents feature-based retrieval models. The Markov random field model he details goes beyond the traditional yet ill-suited bag-of-words assumption in two ways. First, the model can easily exploit various types of dependencies that exist between query terms, eliminating the term independence assumption that often accompanies bag-of-words models. Second, arbitrary textual or non-textual features can be used within the model. As he shows, combining term dependencies and arbitrary features results in a very robust, powerful retrieval model. In addition, he describes several extensions such as an automatic feature selection algorithm and a query expansion framework. The resulting model and extensions provide a flexible framework for highly effective retrieval across a wide range of tasks and data sets. **A Feature-Centric View of Information Retrieval** provides graduate students as well as academic and industrial researchers in the fields of information retrieval and Web search with a modern perspective on information retrieval modeling and Web searches.

Space: Views from the Hubble Telescope Calendar Pomegranate Communications, Inc., 2002-12-01. First deployed in 1990, the Hubble Space Telescope is still delighting us with awe-inspiring images sent from 380 miles above the earth. It continues to educate, opening the book of the universe to our amazed eyes. Each of the twelve images within this calendar is explained in detail, and daily grid entries highlight important events and achievements in the history of space exploration. Witness the formation of a star, observe the heavenly formations of nebulae, and consider the celestial beauty of the galaxies.

**The Universe** Leo Marriott, 2011-12-17. Humans have always been fascinated by what can be seen at first with the naked eye and then with larger and more powerful telescopes. Now with satellite images from space, there is a new dimension to star-gazing. The Universe starts with an examination of the history of astronomy from the earliest times. Next follows a brief history of the Hubble Space Telescope and the technology that supports its sensor package. Beautiful, majestic, full-color photographs illustrate this book and reveal the mysteries of the night sky to readers. Illustrations also help to describe the processes that keep the Universe going and growing and the technology humans use to view these processes and their outcomes. The

M.Eng.,2025-01-30 From the Quantum to the Multiverse Probing the Universe Quantum theory is among the great intellectual achievements of the 20th century and how this came about is interesting in itself Quantum theory was once widely held to resist any realist interpretation and to mark the advent of a postmodern science characterized by paradox uncertainty and the limits of precise measurement It seems that there is a realm of reality in the subatomic or micro physical domain The success of the Aspect Experiment in Paris in 1982 marked the end of the contemplation period with the first direct experimental proof that even the most unusual aspects of QM are a literal description of the way things really are in the real world Further analyses of QM have led scientists to ponder the possibility of multiple dimensions Extra dimensions have changed the way physics think about the Universe And because the connections of extra dimensions in the Cosmos could connect to many more well established physics ideas extra dimensions are a way to approach older already verified facts about the Universe As a consequence of this physicists have postulated the real possibility of parallel universes
