Beyond the Atmosphere: Early Years of Space Science Homer Edward Newell, 1980 **Introduction to Space Sciences and Spacecraft Applications** Bruce A. Campbell, Paula Walter McCandless, 1996-09-12 **An Enabling Foundation for NASA's Earth and Space Science Missions** National Research Council, Division on Engineering and Physical Sciences, Space Studies Board, Committee on the Role and

Scope of Mission-Enabling Activities in NASA's Space and Earth Science Missions, 2010-03-25 NASA's space and Earth science program is composed of two principal components: spaceflight projects and mission enabling activities. Most of the budget of NASA's Science Mission Directorate (SMD) is applied to spaceflight missions, but NASA identifies nearly one quarter of the SMD budget as mission enabling. The principal mission enabling activities, which traditionally encompass much of NASA's research and analysis, include suborbital payloads and flights and complementary ground-based programs, advanced technology development, and advanced mission and instrumentation concept studies. While the Research and Analysis (R&A) program is essential to the development and support of NASA's diverse set of space and Earth science missions, defining and articulating an appropriate scale for mission enabling activities have posed a challenge throughout NASA's history. This volume identifies the appropriate roles for mission enabling activities and metrics for assessing their effectiveness. Furthermore, the book evaluates how, from a strategic perspective, decisions should be made about the balance between mission-related and mission enabling elements of the overall program, as well as the balance between various elements within the mission enabling component. Collectively, these efforts will help SMD to make a good program even better.

Space Science in the Twenty-First Century: Imperatives for the Decades 1995 to 2015: Mission to Planet Earth Task Earth Sciences, Space Board, Commission on Physical Sciences and Resources, Mathematics, and Astronomical Sciences, National Council, 2012-07-30

Early in 1984 NASA asked the Space Science Board to undertake a study to determine the principal scientific issues that the discipline of space science would face during the period from about 1995 to 2015. This request was made partly because NASA expected the Space Station to become available at the beginning of this period and partly because the missions needed to implement research strategies previously developed by the various committees of the board should have been launched or their development under way by that time. A two-year study was called for. To carry out the study, the board put together task groups in earth sciences, planetary and lunar exploration, solar and space physics, astronomy and astrophysics, fundamental physics and chemistry, relativistic gravitation and microgravity sciences, and life sciences. The findings of the study are published in seven volumes, six task group reports of which this volume is one, and an overview report of the steering group. This report outlines a unified program for studying the Earth from its deep interior to its fluid envelopes. It proposes a system of measuring devices involving both space-based and in situ observations that can accommodate simultaneously a large range of scientific needs.

A Meeting with the Universe United States. National Aeronautics and Space Administration, 1981

A Meeting with the Universe is the story of what we learned about the universe and ourselves by going into space. It is not a textbook for scientists. It is written for everyone who shared the excitement and wonder of the last few years: students, teachers, scientists, other professional people, and curious citizens of all kinds. It is not a NASA history. It is a

history of space exploration by NASA by universities by other government agencies and by industries all of whom have played major roles We have not attempted to apportion credit here space has been studied by many and the discoveries belong to us all The book itself is a novel experiment in writing about science for non scientific readers It was not produced by science writers or journalists but written and edited entirely by a group of NASA scientists all of whom are deeply involved in space science activities and many of whom actively participated in the discoveries they describe We are now at a watershed in space After 20 years of challenging and exciting activity we have done most of the easy things and made most of the obvious discoveries What do we do next How do we tackle the many new questions that have arisen about the Sun the Earth the other worlds the universe around us and ourselves These are not just scientific questions Their answers involve the understanding of the Earth s geology its weather and its climate factors that will affect the survival of our civilization perhaps even of our species Although we have only begun our movement into space we have already traveled far and seen much We have a shining vision of the universe and our future in it Without that vision without the will to follow it something important in us perhaps we ourselves will perish From the preface Dr John E Naugle Chief Scientist NASA

Space Science in the Twenty-First Century: Imperatives for the Decades 1995 to 2015: Overview Report of the Group,Space Board,Commission On Physical Scienc Resources,Mathematics, and, Commission on Physical Resources,National Council,2012-07-30

The past quarter century of space science has been extraordinarily productive The United States has held the lead in space science during most of these years exploring new worlds discovering new phenomena in space and providing new ways to observe and predict changes in the global environment The national space science program has amply fulfilled the objective of the National Aeronautics and Space Act of 1958 to extend human knowledge of the Earth and of phenomena in the atmosphere and in space Moreover it has contributed substantially to other objectives set forth in the act including the development of space technology the preservation of U S leadership in space and the fostering of international cooperation National investment in space science has produced a treasure of trained people and facilities that can continue to be productive far into the future It is a perishable treasure however and is eroding rapidly with the present lack of scientific missions and the aging of academic facilities For the past 30 years scientific investigation has been neither the only objective of the space program of the United States nor even the dominant one The Apollo project and the development of the Space Transportation Systems and more recently of the Space Station were not primarily designed to respond to requirements set by the various disciplines of space science Instead establishing a human presence in space and accomplishment of large engineering projects for their own sake have driven a major part of our space program since the establishment of NASA in 1958 The steering group for this study recommends that the present ordering of priorities in the national space program be changed The steering group proposes that as the nation considers its future in space the advance of science and its applications to human welfare be adopted and implemented as an objective no less central to the space program of the United States than
