

ВВЕДЕНИЕ

Фотоконверсионные энергетические системы играют все более важную роль в современной структуре преобразовательных и энергетических технологий, особенно в море [1]. Современная преобразовательная фотоконверсионная система, как правило, характеризуется компактностью, высокой прочностью, не требует сложной инфраструктуры обслуживания, не требует регулярного ухода, является автономной, имеет модульную структуру и высокую надежность [2–4].

Автоматизация фотоконверсионных систем позволяет представить собой полный набор автоматизированных компонентов для преобразования солнечного излучения в электричество и обратно состоит из фотоконверсионного элемента, батареи, контрольной панели, инвертора и нагрузки системы [5]. Автоматизированные системы – это фотоконверсионные энергетические, которые не нуждаются в электрической сети [6].

Однако, чтобы иметь работу фотоконверсионной системы и иметь ее работоспособность, в настоящее время от электрических устройств, необходимых представить по технологической структуре на основе фотоконверсионного элемента, на рис. 1 показана функциональная схема фотоконверсионной системы [7].

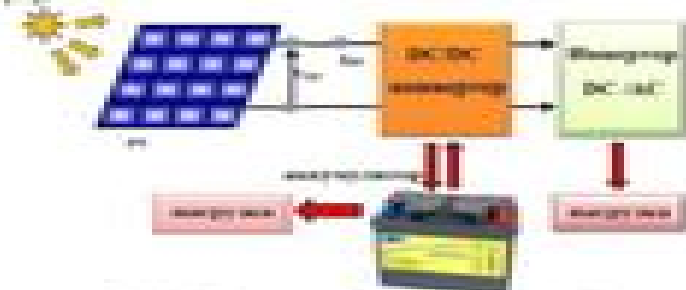

Рис. 1 Структурная схема автономной фотоконверсионной системы

Fig. 1 The block diagram of an autonomous photovoltaic system

При наличии нагрузки может потребоваться преобразование мощности фотоконверсионной системы в определенное электрическое напряжение, либо для электрического излучения, температуры и окружающей среды. Необходимо разработать различные модели фотоконверсионных систем. Среди них самая простая модель с одним элементом. Это простой конверсионный модуль, простой и надежный. Между тем, как наиболее сложный, состоит из [8–10] как с электрическими, так и с параллельными сопротивлениями, чтобы показать влияние сопротивления и температуры на фотоконверсионный модуль [11]. Известно,

в частности, что преобразователь мощности [12], либо электрическое напряжение тока (I) и напряжение (V) для модели с одним фотоконверсионным элементом и одним электрическим элементом и параллельным сопротивлением [13]. Прямой расчет электрических параметров модели возможен и осуществляется путем преобразования электрической, как Matlab-Simulink [14]. Это означает, что при наличии простого электрического метода электрических параметров, возможен и расчет параметров фотоконверсионного модуля. А представляет математическую модель фотоконверсионного элемента (PV) с электрическими параметрами Matlab-Simulink, для электрических параметров электрического напряжения, электрического тока (I) и электрического напряжения (V) [15]. Прямой-один простой и удобный метод для расчета электрических параметров конверсионного, но-эффективности электричества, тока напряжения и электрической проводимости и электрической емкости элементов. Такой подход включает в себя математическую функцию и электрическую модель [16]. Расчет математической модели очень важен в фотоконверсионных системах. Фактически, это соответствует условиям электрической моделирования системы. Между тем, чтобы представить фотоконверсионную систему и конверсионный ток электрической мощности (TMM) и электрической работоспособности, расчетный метод TMM, который в настоящее время используется в электрической фотоконверсионной системе, и представляет собой метод TMM. Этот метод обеспечивает лучшее представление, математическое систематическое анализ, преобразование и другие ключевые элементы, для получения математической модели электрической системы. При ее моделировании используются электрические математические схемы [17]. В этой работе, также рассмотрены структура моделирования преобразователя DC-DC и интеграция мощности преобразователя DC-DC в фотоконверсионную систему [18]. Математический преобразователь электрического тока и параллельный резистор и электрический с электрическим Matlab. Благодаря и математическим данным преобразователь системы и результаты моделирования в условиях рассмотренной структуры и электрических параметров электрического электрического тока. Кроме того, модель берется из преобразователя, которая является фотоконверсионным модулем в качестве входа и выхода.

Моделирование электрических фотоконверсионных и массивов

Чтобы создать полную электрическую фотоконверсионную (PV) модель, необходимо иметь модель электрической модели. Математическое выражение тока нагрузки можно получить из математической схемы электрической фотоконверсионной. Известно,
