Multi-State Survival Models for Interval-Censored Data Ardo van den Hout, 2016-11-25 Multi State Survival Models for Interval Censored Data introduces methods to describe stochastic processes that consist of transitions between states over time It is targeted at researchers in medical statistics epidemiology demography and social statistics One of the applications in the book is a three state process for dementia and survival in the older population This process is described by an illness death model with a dementia free state a dementia state and a dead state Statistical modelling of a multi state process can investigate potential associations between the risk of moving to the next state and variables such as age gender or education A model can also be used to predict the multi state process The methods are for longitudinal data subject to interval censoring Depending on the definition of a state it is possible that the time of the transition into a state is not observed exactly However when longitudinal data are available the transition time may be known to lie in the time interval defined by two successive observations Such an interval censored observation scheme can be taken into account in the statistical inference Multi state modelling is an elegant combination of statistical inference and the theory of stochastic processes Multi State Survival Models for Interval Censored Data shows that the statistical modelling is versatile and allows for a wide range of applications
