Permutation Tests in Shape Analysis LUIGI SALMASO, Chiara Brombin, 2013-09-06 Statistical shape analysis is a geometrical analysis from a set of shapes in which statistics are measured to describe geometrical properties from similar shapes or different groups for instance the difference between male and female Gorilla skull shapes normal and pathological bone shapes etc Some of the important aspects of shape analysis are to obtain a measure of distance between shapes to estimate average shapes from a possibly random sample and to estimate shape variability in a sample

1 One of the main methods used is principal component analysis Specific applications of shape analysis may be found in archaeology architecture biology geography geology agriculture genetics medical imaging security applications such as face recognition entertainment industry movies games computer aided design and manufacturing This is a proposal for a new Brief on statistical shape analysis and the various new parametric and non parametric methods utilized to facilitate shape analysis

The Statistical Theory of Shape Christopher G. Small, 2012-12-06 In general terms the shape of an object data set or image can be defined as the total of all information that is invariant under translations rotations and isotropic rescalings Thus two

objects can be said to have the same shape if they are similar in the sense of Euclidean geometry For example all equilateral triangles have the same shape and so do all cubes In applications bodies rarely have exactly the same shape within measurement error In such cases the variation in shape can often be the subject of statistical analysis The last decade has seen a considerable growth in interest in the statistical theory of shape This has been the result of a synthesis of a number of different areas and a recognition that there is considerable common ground among these areas in their study of shape variation Despite this synthesis of disciplines there are several different schools of statistical shape analysis One of these the Kendall school of shape analysis uses a variety of mathematical tools from differential geometry and probability and is the subject of this book The book does not assume a particularly strong background by the reader in these subjects and so a brief introduction is provided to each of these topics Anyone who is unfamiliar with this material is advised to consult a more complete reference As the literature on these subjects is vast the introductory sections can be used as a brief guide to the literature

Statistical Shape Analysis of Facial Motions Kirsten T. Namesnik, 2000 **Parametric and Nonparametric Inference for Statistical Dynamic Shape Analysis with Applications** Chiara Brombin, Luigi Salmaso, Lara Fontanella, Luigi Ippoliti, Caterina Fusilli, 2016-02-11 This book considers specific inferential issues arising from the analysis of dynamic shapes with the attempt to solve the problems at hand using probability models and nonparametric tests The models are simple to understand and interpret and provide a useful tool to describe the global dynamics of the landmark configurations However because of the non Euclidean nature of shape spaces distributions in shape spaces are not straightforward to obtain The book explores the use of the Gaussian distribution in the configuration space with similarity transformations integrated out Specifically it works with the offset normal shape distribution as a probability model for statistical inference on a sample of a temporal sequence of landmark configurations This enables inference for Gaussian processes from configurations onto the shape space The book is divided in two parts with the first three chapters covering material on the offset normal shape distribution and the remaining chapters covering the theory of NonParametric Combination NPC tests The chapters offer a collection of applications which are bound together by the theme of this book They refer to the analysis of data from the FG NET Face and Gesture Recognition Research Network database with facial expressions For these data it may be desirable to provide a description of the dynamics of the expressions or testing whether there is a difference between the dynamics of two facial expressions or testing which of the landmarks are more informative in explaining the pattern of an expression Nonrigid Shape Correspondence for Statistical Shape Analysis Theodor Dan Richardson, 2006 **Shape Analysis in Medical Image Analysis** Shuo Li, João Manuel R. S. Tavares, 2014-01-28 This book contains thirteen contributions from invited experts of international recognition addressing important issues in shape analysis in medical image analysis including techniques for image segmentation registration modelling and classification and applications in biology as well as in cardiac brain spine chest lung and clinical practice This volume treats topics such as for

example anatomic and functional shape representation and matching shape based medical image segmentation shape registration statistical shape analysis shape deformation shape based abnormality detection shape tracking and longitudinal shape analysis machine learning for shape modeling and analysis shape based computer aided diagnosis shape based medical navigation benchmark and validation of shape representation analysis and modeling algorithms This work will be of interest to researchers students and manufacturers in the fields of artificial intelligence bioengineering biomechanics computational mechanics computational vision computer sciences human motion mathematics medical imaging medicine pattern recognition and physics **Statistical Shape Analysis for Bilateral Symmetry** Kolamunnage Dona Rasanga

Statistical shape analysis is an emerging field of research that analyzes the geometrical properties of a given set of shapes or objects using different statistical methods Two important aspects of the shape analysis are to estimate the mean shape from a given set of shapes and to estimate a shape trajectory as close as to the observed shapes in order to determine the continuous evaluation of shapes over time A deterministic Atlas model is used to compute the mean shape also referred to as atlas construction from a set of shapes which builds a generalization of a typical representation by preserving the characteristics of the original shapes Thus mean shape is useful in forecasting trends in form or pulling out stereotypes from a set of homologous shapes The Geodesic regression is used to estimate the continuous shape evaluation at a certain time within its intervals where the mean face obtained from the deterministic atlas model can be used as baseline shape or initial template face to initiate the program In this thesis we are showing the application of the deterministic atlas model and geodesic regression model using a shape analysis software called Deformetrica We collected data from the three Dimensional Facial Norm 3DFN database which provides craniofacial anthropometric normative data deposited in the FaceBase consortium Our data are 3D facial mesh where each facial mesh contains a high number of landmark points We applied the deterministic atlas model using Deformetrica accessing the GPU allocation which helps to estimate the mean facial object We used this mean facial object as an initial template shape on geodesic regression which provides an estimated shape trajectory of the facial objects This geodesic shape trajectory is a geodesic flow of diffeomorphisms acting on the above baseline template shape to estimate the continuous 3D facial evaluation with age varying continuously within its range This thesis also describes the technical details of using Deformetrica in a high performance computing environment while dealing a 3D geometric objects with a high number of landmark points
