Statistical Physics II Nonequilibrium Statistical Mechanics:

Statistical Physics II R. Kubo, M. Toda, N. Hashitsume, 2012-12-06 This volume of Statistical Physics constitutes the second part of Statistical Physics Springer Series in Solid State Science Vols 30 31 and is devoted to nonequilibrium theories of statistical mechanics We start with an introduction to the stochastic treatment of Brownian motion and then proceed to general problems involved in deriving a physical process from an underlying more basic process Relaxation from nonequilibrium to equilibrium states and the response of a system to an external disturbance form the central problems of nonequilibrium statistical mechanics These problems are treated both phenomenologically and microscopically along the lines of recent developments Emphasis is placed on fundamental concepts and methods rather than on applications which are too numerous to be treated exhaustively within the limited space of this volume For information on the general aim of this book the reader is referred to the Foreword For further reading the reader should consult the bibliographies although these are not meant to be exhaustive

Statistical Physics II Ryogo Kubo, Morikazu Toda, Natsuki Hashitsume, 2012-12-06 Statistical Physics II introduces nonequilibrium theories of statistical mechanics from the viewpoint of the fluctuation dissipation theorem Emphasis is placed on the relaxation from nonequilibrium to equilibrium states the response of a system to an external disturbance and general problems involved in deriving a macroscopic physical process from more basic underlying processes Fundamental concepts and methods are stressed rather than the numerous individual applications

Non-equilibrium Statistical Physics with Application to Disordered Systems Manuel Osvaldo Cáceres, 2017-03-07 This textbook is the result of the enhancement of several courses on non equilibrium statistics, stochastic processes, stochastic differential equations, anomalous diffusion, and disorder. The target audience includes students of physics, mathematics, biology, chemistry, and engineering at undergraduate and graduate level with a grasp of the basic elements of mathematics and physics of the fourth year of a typical undergraduate course. The little known physical and mathematical concepts are described in sections and specific exercises throughout the text as well as in appendices. Physical mathematical motivation is the main driving force for the development of this text. It presents the academic topics of probability theory and stochastic processes as well as new educational aspects in the presentation of non equilibrium statistical theory and stochastic differential equations. In particular, it discusses the problem of irreversibility in that context and the dynamics of Fokker-Planck. An introduction on fluctuations around metastable and unstable points are given. It also describes relaxation theory of non stationary Markov periodic in time systems. The theory of finite and infinite transport in disordered networks with a discussion of the issue of anomalous diffusion is introduced. Further, it provides the basis for establishing the relationship between quantum aspects of the theory of linear response and the calculation of diffusion coefficients in amorphous systems.

Geometrical Formulation of Renormalization-Group Method as an Asymptotic Analysis Teiji Kunihiro, Yuta Kikuchi, Kyosuke Tsumura, 2022-04-01 This book presents a comprehensive account of the renormalization group (RG) method and its extension, the doublet scheme, in a geometrical point of view. It extracts long timescale macroscopic mesoscopic dynamics from microscopic equations in an intuitively understandable way rather than in a mathematically rigorous manner and introduces readers to a mathematically elementary but useful and widely applicable technique for analyzing asymptotic solutions in mathematical models of nature. The book begins with the basic notion of the RG theory, including its connection with the separation of scales. Then it formulates the RG method as a construction method of envelopes of the naive perturbative solutions containing secular terms and then demonstrates the formulation in various types of evolution equations. Lastly, it describes successful physical examples such as stochastic and transport phenomena, including second order relativistic as well as nonrelativistic fluid dynamics with causality and transport phenomena in cold atoms with extensive numerical expositions of transport coefficients and relaxation times. Requiring only an undergraduate level

understanding of physics and mathematics the book clearly describes the notions and mathematical techniques with a wealth of examples It is a unique and can be enlightening resource for readers who feel mystified by renormalization theory in quantum field theory
