

CHAPTER (2)

Statistical Treatment of Experimental Data

Introduction

This laboratory course concerns making measurements in various heat transfer geometries and relating those measurements to derived equations. The objective is to determine how well the derived equations describe the physical phenomena we are modeling. In doing so, we will need to make physical measurements, and it is essential that we learn how to practice good techniques in making scientific observations and in obtaining measurements. We are making quantitative estimates of physical phenomena under controlled conditions.

Measurements

There are certain primary desirable characteristics involved when making these physical measurements. We wish that our measurements would be:

- a) Observer-independent
- b) Consistent
- c) Quantitative

So when reporting a measurements, we will be stating a number, but what's in a number? A single number, in isolation, has almost no significance, but the implied question is, "Is it large or small?"

Is 26 a large number? Is 6×10^5 a large number? The answer requires another number for reference purposes. Is 26 a large number compared to 6×10^5 ? Furthermore, we will have to add a dimension and this leads to another question: Are we talking about a number or a dimensional physical quantity? We know from experience that a physical value without a unit has no significance.

In reporting measurements, another question arises as to how should we report data; i.e., how many significant digits should we include? Which physical quantity is associated with the measurement and how precise should it or could it be.

For example, does $2.54 \text{ cm} = 2.54001 \text{ cm}$? It is impossible to answer this question without some measure of the expected natural variation in the measurement. So it is prudent to scrutinize the claimed or implied accuracy of a measurement.

Performing experiments

In the course of performing an experiment, we first would develop a set of questions or a hypothesis, or put forth the theory. We then identify the system variables to be measured or controlled. The apparatus would have to be developed and the equipment set up in a particular way. An experimental protocol, or procedure, is established and data are taken.

Several features of this process are important. We want accuracy in our measurements, but increased accuracy generally corresponds to an increase in cost. We want the experiments to be reproducible, and we seek to minimize errors. Of course we want to address all safety issues and regulations.

After we run the experiment, and obtain data, we would analyze the results, draw conclusions, and report the results.

Estimation

In some situations, there is no time to run formal experiments to answer a question or verify an
