Surface Analytical Techniques:

Methods of Surface Analysis A.W. Czanderna, 2012-12-02 Methods of Surface Analysis deals with the determination of the composition of surfaces and the identification of species attached to the surface. The text applies methods of surface analysis to obtain a composition depth profile after various stages of ion etching or sputtering. The composition at the solid-surface interface is revealed by systematically removing atomic planes until the interface of interest is reached, in which the investigator can then determine its composition. The book reviews the effect of ion etching on the results obtained by any method of surface analysis, including the effect of the rate of etching, incident energy of the bombarding ion, the properties of the solid, the effect of the ion etching on generating an output signal of electrons, ions or neutrals. The text also describes the effect of the residual gases in the vacuum environment. The book considers the influence of the sample geometry, the type of metal, insulator, semiconductor, organic and of the atomic number, which can have on surface analysis. The text describes in detail low energy ion scattering spectroscopy, X-ray photoelectron spectroscopy, Auger electron spectroscopy, secondary ion mass spectroscopy and infrared reflection absorption spectroscopy. The book can prove useful for researchers, technicians and scientists whose works involve organic chemistry, analytical chemistry and other related fields of chemistry such as physical chemistry or inorganic chemistry. *Surface Analysis Methods in Materials Science* D.J. O'Connor, Brett A. Sexton, Roger St.C. Smart, 2013-04-17

The idea for this book stemmed from a remark by Philip Jennings of Murdoch University in a discussion session following a regular meeting of the Australian Surface Science group. He observed that a text on surface analysis and applications to materials suitable for final year undergraduate and postgraduate science students was not currently available. Furthermore, the members of the Australian Surface Science group had the research experience and range of coverage of surface analytical techniques and applications to provide a text for this purpose. A list of techniques and applications to be included was agreed at that meeting. The intended readership of the book has been broadened since the early discussions, particularly to encompass industrial users, but there has been no significant alteration in content. The editors, in consultation with the contributors, have agreed that the book should be prepared for four major groups of readers: senior undergraduate students in chemistry, physics, metallurgy, materials science and materials engineering; postgraduate students undertaking research that involves the use of analytical techniques; groups of scientists and engineers attending training courses and workshops on the application of surface analytical techniques in materials science; industrial scientists and engineers in research and development seeking a description of available surface analytical techniques and guidance on the most appropriate techniques for particular applications. The contributors mostly come from Australia, with the notable exception of Ray Browning from Stanford University. **Surface Analysis Methods in Materials Science** John
