Surface Science of Ultrathin Metal Oxide Films J. Matharu, 2011 The properties of metal oxide surfaces are key to their diverse technological applications However the semiconducting nature of metal oxides presents a problem many surface science techniques are electron based and thus require samples to be conducting As such bulk crystal studies of metal oxides by techniques such as photoemission spectroscopy PES and scanning tunneling microscopy STM are limited to reduced surfaces Alternatively thin films of a metal oxide can be synthesised on a suitable conducting substrate that mimic the bulk crystal surface whilst having sufficient conducting character to use these techniques CeO₂ is an important material found in three way catalysts that remove pollutants from the exhaust gas of modern automobiles Key to this application is the ability of reduced ceria to store and release oxygen depending on the composition of the exhaust The addition of noble metals

such as Pd to the ceria surface greatly improves the efficiency of pollutant conversion evidenced by X ray photoelectron spectroscopy XPS by reducing the ceria Resonance photoemission spectroscopy RESPES has been used to investigate the effect of Pd on ceria CeO_2 x 110 thin films grown on a Pt 111 substrate RESPES is more surface specific than XPS and thus reveals more information on the surface layers of ceria films TiO_2 110 is the most studied metal oxide surface and has a multitude of applications Its chemistry with two of the most abundant chemical species water H_2O and oxygen O_2 is thus very important H_2O has been shown to dissociate on TiO_2 surfaces TiO_2 thin films grown on W 100 were used as model system to study the chemistry of the reaction between TiO_2 and H_2O and subsequently the reaction of hydrated surfaces with O_2 using XPS STM was used to examine the morphology of TiO_2 110 films grown on W 100 2 x 1 O changes with film thickness and methods of improving surface smoothness The first detailed STM images showing row structure of TiO_2 110 films grown on W are shown *Scanning Tunneling Microscopy in Surface Science, Nanoscience, and Catalysis* Michael Bowker, Philip R. Davies, 2009-11-11 Here top international authors in the field of STM and surface science present first class contributions on this hot topic bringing the reader up to date with the latest developments in this rapidly advancing field The focus is on the nanoscale particularly in relation to catalysis involving developments in our understanding of the nature of the surfaces of oxides and nanoparticulate materials as well as adsorption and includes in situ studies of catalysis on such model materials Of high interest to practitioners of surface science nanoscience STM and catalysis **Proceedings of the International Conference on Colloid and Surface Science** Y. Iwasawa, N. Oyama, H. Kunieda, 2001-02-15 The purpose of this Conference was to discuss the results of recent developments and the future prospect in science and technology of the field The field has been growing and flourishing while indicating many problems to be uncovered and solved The conference was structured to encourage interaction and to stimulate the exchange of ideas to accomplish the above purpose Key issues and materials related to the Conference were included as follows Molecular Assemblies in Solutions Fine Particles and Colloidal Dispersions Supramolecular Organized Films Nanostructural Solid Surfaces Industrial Applications and Products The Conference comprised 2 plenary lectures 42 invited lectures 150 oral presentations and 266 poster presentations
