*Cerebrovascular Diseases in Children* Anthony J. Raimondi, Maurice Choux, Concezio DiRocco, 2012-12-06 It is estimated that the functionally significant body of knowledge for a given medical specialty changes radically every 8 years New specialties and sub specialization are occurring at approximately an equal rate Historically established journals have not been able either to absorb this increase in publishable material or to extend their readership to the new specialists International and national meetings symposia and seminars workshops and newsletters successfully bring to the attention of physicians within developing specialties what is occurring but generally only in demonstration form without providing historical perspective pathoanatomical correlates or extensive discussion Page and time limitations oblige the authors to present only the essence of their material Pediatric neurosurgery is an example of a specialty that has developed during the past 15 years Over this period neurosurgeons have obtained special training in pediatric neurosurgery and then dedicated themselves primarily to its practice Centers Chairs and educational programs have been established as groups of neurosurgeons in different countries throughout the world organized themselves respectively into national and international societies for pediatric neurosurgery These events were both preceded and followed by specialized courses national and international journals and ever increasing clinical and investigative studies into all aspects of surgically treatable diseases of the child's nervous system

*Surgical Neuroangiography* Pierre L. Lasjaunias, A. Berenstein, Alex Berenstein, 1992 In Volume 5 of Surgical Neuroangiography we will discuss indications and approaches for endovascular treatment of disorders affecting the spine and spinal cord circulations Our approach is similar to those discussed in volume 2 and 4 it requires integration of knowledge concerning functional vascular anatomy lesion angioarchitecture and the relationship between normal and pathological circulations In AVMs these features are considered as they relate to the clinical presentation progression and natural history of the lesion All these factors must then be combined with an understanding of technical capabilities to formulate a pretherapeutic plan designed to favorably affect the long term outcome in the individual patient Endovascular surgery of spinal cord AVMs has become the treatment of choice while microsurgery is reserved for those cases where embolization fails Endovascular surgery may be the sole form of treatment or may be combined with other therapeutic modalities including surgery chemotherapy or radiation in cases of neoplasms or may be palliative to decrease pain or spinal cord compression As in all other areas a multidisciplinary ap

proach is essential for decision making to best accomplish the desired objectives
