Greenhouse Gas Removal Technologies Mai Bui, Niall Mac Dowell, 2022-08-22 Greenhouse gas removal GGR technologies can remove greenhouse gases such as carbon dioxide from the atmosphere. Most of the current GGR technologies focus on carbon dioxide removal; these include afforestation and reforestation, bioenergy with carbon capture and storage, direct air capture, enhanced weathering, soil carbon sequestration, and biochar. Ocean fertilisation and coastal blue carbon GGR technologies will be essential in limiting global warming to temperatures below 1.5°C targets by the IPCC and COP21 and will be required to achieve deep reductions in atmospheric CO₂ concentration. In the context of recent legally binding legislation requiring the transition to a net zero emissions economy by 2050, GGR technologies are broadly recognised as being indispensable. This book provides the most up-to-date information on GGR technologies that provide removal of atmospheric CO₂, giving insight into their role and value in achieving climate change mitigation targets. Chapters discuss the issues associated with commercial development and deployment of GGRs, providing potential approaches to overcome these hurdles through a combination of political, economic, and R D strategies. With contributions from leaders in the field, this title is an indispensable resource for graduate students and researchers in academia and industry working in chemical engineering, mechanical engineering, and energy policy.

Sustainable Dryland Farming A.M. Dhopte, 2020-10-09 Sustainability is extremely important in dryland farming under global climatic change. Technology devised by various agricultural institutions is provided in this book. Variation in environmental factors may influence the entire ecological system, which may not be ideal for agriculture. Under such a global scenario, plant growth is under jeopardy. New varieties have to be developed to suit the varied climate or crop strategy in view of crop domain suitability. Ideal available temperature has to be framed to make dryland farming sustainable. Various agrotechnologies need to be adapted to avoid depletion in productivity. Global climatic change in the future may limit the productivity of available varieties. Corporate farming may come to rescue the problem under the present scenario. Various agrotechnologies described in this book may help the farmers and planners to overcome the situation in the future. Critical problems have been dealt with probable solutions to suit the requirements. Multicropping system, organic farming,

framework to help set the research agenda Zhang, Wei,Walker, Dominic,Hernandez, Carlos Calvo,Elias, Marlène,Meinzen-Dick , Ruth,Nkonya, Ephraim,2019-04-10 Healthy soils play a critical role in supporting agricultural productivity climate change mitigation and resilience and a range of ecosystem services Degraded and poorly responsive soils cover large areas of Africa and represent the majority of poor farmers fields in certain regions While there are hundreds of technical options for improving the sustainability of land management and preventing or reversing degradation there are many sociocultural institutional economic and policy barriers hindering their adoption at large scale At the same time there is an emerging consensus within the international development community that gender equality and women s empowerment are both an end in themselves and an important means for achieving a range of economic and social development objectives such as improved food security child nutrition and education and women s health Yet gender inequality remains a wicked problem whose deep seated socio economic and ideological causes are difficult to recognize and address and which require

context and culture specific understandings and approaches involving multiple stakeholders with different and sometimes conflicting interests and different positions within power hierarchies There is an urgent need to make more rapid progress on restoring and sustaining soil productivity and ecosystem functions and also to leverage soil health management for progress on gender equality While there are important interconnections between soil health and gender equality and empowerment these are seldom recognized and have not been addressed in a coherent or concerted manner In this study we have reviewed relevant gender literature and proposed a conceptual framework to help illuminate important gender considerations for soil health and land management These considerations are essential for identifying gender based constraints opportunities and unintended consequences in promoting soil management technologies Moreover the application of the framework can help guide in priority setting with respect to where gender responsive interventions are essential We make several

recommendations for setting priorities for gender soil health research **Soil Management and Greenhouse Effect** John M. Kimble, Elissa R. Levine, Bobby A. Stewart, 1995-03-23 Soil Management and Greenhouse Effect focuses on proper management of soils and its effects on global change specifically the greenhouse effect It contains up to date information on a broad range of important soil management topics emphasizing the critical role of soil for carbon storage Sequestration and emission of carbon and other gases are examined in various ecosystems in both natural and managed environments to provide a comprehensive overview This useful reference includes chapters that address policy issues as well as research and development priorities The material in this volume is valuable not only to soil scientists but to the entire environmental science community Economic Development, Agriculture And Climate Change Antonio Yunez Naude, J Jorge

Mora-rivera, 2023-02-24 Climate change CC is currently an unquestionable phenomenon If not stopped it will be catastrophic for life on earth Scientific evidence shows that human activities are the primary driver of CC tendencies since the industrial times In this book we present the relationship between development and CC with special reference to agriculture the rural sector and policies aimed to promote sustainable development We also give special attention to the situation in low and medium income countries particularly rural households and small farmers in these countries The study of agriculture CC and sustainability requires consideration of natural resources and their uses land freshwater forests etc as well as the rural sector since land for agricultural production often expands at the expense of forests In addition the use of water for agricultural production affects the availability of this resource for other uses in the urban industrial and service sectors Consequently sustainable agricultural development under CC requires an interdisciplinary or at least a multidisciplinary approach In this book we do our best to deal with this challenge by focusing on issues and topics related to agriculture and its use of natural resources in the context of CC but without ignoring the interrelations of these phenomena with further aspects of sustainability beyond agriculture Grass, Soil, Hope Courtney White, 2014-05-23 What can we do about the seemingly intractable challenges confronting all of humanity today including climate change global hunger water scarcity

environmental stress and economic instability The quick answers are Build topsoil Fix creeks Eat meat from pasture raised animals Scientists maintain that a mere 2 percent increase in the carbon content of the planet's soils could offset 100 percent of all greenhouse gas emissions going into the atmosphere But how could this be accomplished What would it cost Is it even possible Yes says author Courtney White it is not only possible but essential for the long term health and sustainability of our environment and our economy Right now the only possibility of large scale removal of greenhouse gases from the atmosphere is through plant photosynthesis and related land based carbon sequestration activities These include a range of already existing low tech and proven practices composting no till farming climate friendly livestock practices conserving natural habitat restoring degraded watersheds and rangelands increasing biodiversity and producing local food In *Grass Soil Hope* the author shows how all these practical strategies can be bundled together into an economic and ecological whole with the aim of reducing atmospheric CO₂ while producing substantial co benefits for all living things Soil is a huge natural sink for carbon dioxide If we can draw increasing amounts carbon out of the atmosphere and store it safely in the soil then we can significantly address all the multiple challenges that now appear so intractable
