**Materials and Contact Characterisation IX** S. Hernández, D. O. Northwood, J. De Hosson, R. Vilar, 2019-07-23 Including papers from the 9th edition of the International Conference on Computational Methods and Experiments in Material and Contact Characterisation this volume presents the work of selected researchers on the subject Material and contact characterisation is a rapidly advancing field and this volume contains the latest research Of particular interest to industry and society is the knowledge of surface treatment and contact mechanics of these materials to determine the in service behaviour of components subject to contact conditions Modern society requires systems that operate at conditions that use resources effectively In terms of components durability the understanding of surface engineering wear frictional and lubrication dynamics has never been so important Current research is focussed on modification technologies that can

increase the surface durability of materials The characteristics of the system reveal which surface engineering methods should be chosen and as a consequence it is essential to study the combination of surface treatment and contact mechanics The accurate characterisation of the physical and chemical properties of materials requires the application of both experimental techniques and computer simulation methods in order to gain a correct analysis A very wide range of materials starting with metals through polymers and semiconductors to composites necessitates a whole spectrum of characteristic experimental techniques and research methods The papers in the book cover a number of topics including Computer methods and simulation Experimental and measurement techniques Mechanical characterisation and testing Materials under extreme conditions Polymers and plastics Advances in composites Micro and macro characterisation Corrosion and erosion Damage fatigue and fracture Recycled materials Materials and energy Surface problems and contact mechanics Surface modification and treatments Thick and thin coatings Tribomechanics and wear mechanics Biomechanical characterisation Biomechanical applications and Case studies

#### **Advanced Analytical Methods in Tribology**

Martin Dienwiebel, Maria-Isabel De Barros Bouchet, 2018-10-04 This book presents the basics and methods of nanoscale analytical techniques for tribology field It gives guidance to the application of mechanical microstructural chemical characterization methods and topography analysis of materials It provides an overview of the of state of the art for researchers and practitioners in the field of tribology It shows different examples to the application of mechanical microstructural chemical characterization methods and topography analysis of materials Friction and Wear phenomena are governed by complex processes at the interface of sliding surfaces For a detailed understanding of these phenomena many surface sensitive techniques have become available in recent years The applied methods are atom probe tomography in situ TEM SERS NEXAFS in situ XPS nanoindentation and in situ Raman spectroscopy A survey of new related numerical calculations completes this book This concerns ab initio coupling numerical calculations for mechanical aspects and density functional theory DFT to study chemical reactivity

#### **Synthesis and Characterization of Diamond-like Carbon Coatings Deposited by Plasma Source Ion**

**Implantation and Conventional Ion Beam Assisted Deposition Processes** Brian M. Stout, 1999 Diamond like carbon coatings produced by Plasma Source Ion Implantation PSII and beamline Ion Beam Assisted Deposition IBAD were synthesized and studied Gas pressure and electrical current were used as variables to design four independent PSII test sets Beamline IBAD samples were produced with a pre optimized set of parameters Profilometry measurements showed the films to have thicknesses between 1 44 09 and 1 64 04 microns and to possess very low roughness averages ranging from 14 3 to 28 3 nm which correlate with substrate surface roughness Atomic Force Microscopy revealed that diamond like carbon

crystal sizes varied significantly with chamber pressure Crystals were generally spherical in shape suggesting that films were highly amorphous Microhardness and nanohardness test results showed the hardest films to be greater than 3 times the hardness of untreated steel The elastic modulus of the films measured during the nanohardness test was directly related to film hardness Fretting wear and Pin on Disk tests were performed to quantitatively assess the ability of films to resist wear Fretting wear tests showed a dramatic decrease in friction for diamond like carbon films with friction levels ranging from 10% to 30% of that of untreated steel Pin on Disk tests revealed a significant improvement in wear resistance prior to stylus penetration into the substrate
