Bennett, 2017-09-29 Written during the height of the ecology movement The Ecological Transition is a stunning interdisciplinary work It combines anthropology ecology and sociology to formulate an understanding of cultural environmental relationships While anthropologists have been studying relationships between humans and the physical environment for a very long time only in the last thirty years have questions inherent in these relationships broadened beyond description and classification For example the concept of environment has been extended beyond the physical into the social Although anthropologists have adopted many of the concepts that Bennett develops in the book he also feels that the central issues have never been addressed either by anthropologists or by people in related disciplines The most important of these in Bennett's opinion is the failure to incorporate a respect for the environmental in contemporary culture which would allow making exceptions in certain human practices in order to protect the environment His point in The Ecological Transition is that a basic cultural change in modern civilization is necessary to achieve this end Both a theoretical and a practical work The Ecological Transition emphasizes the relationships between human culture the physical environment technology and social policy The Ecological Transition is a challenging volume that makes us face the consequences of human behavior in the modern world its effect on pollution natural resources agriculture the economy and population to name just a few areas The book remains a significant contribution to the discourse on social economic and environmental problems While the book was first published in 1976 it still reads as a contemporary tract

Human Biological Diversity Daniel E. Brown, 2015-11-17 This text is intended for the sophomore level course in human variation human biology taught in anthropology departments It may also serve as a supplementary text in introductory physical anthropology courses In addition to covering the standard topics for the course it features contemporary topics in human biology such as the Human Genome Project genetic engineering the effects of stress obesity and pollution *Current Catalog* National Library of Medicine (U.S.), 1970 First multi year cumulation covers six years 1965 70 **Western Civilization in Biological Perspective** Stephen Vickers Boyden, 1987 The author explores the patterns of interplay between the biological and cultural processes in human affairs beginning with the emergence in evolution of homo sapiens and carries his survey through the early farming and urban phases of human existence up to the present day *Medical Sociology: The nature of medical sociology* Graham Scambler, 2005 *Advances in Historical Ecology* William L. Balée, 2012-09-18 Ecology is an attempt to understand the reciprocal relationship between living and nonliving elements of the earth For years however

the discipline either neglected the human element entirely or presumed its effect on natural ecosystems to be invariably negative. Among social scientists notably in geography and anthropology efforts to address this human environment interaction have been criticized as deterministic and mechanistic. Bridging the divide between social and natural sciences the contributors to this book use a more holistic perspective to explore the relationships between humans and their environment. Exploring short and long term local and global change eighteen specialists in anthropology geography history ethnobiology and related disciplines present new perspectives on historical ecology. A broad theoretical background on the material factors central to the field is presented such as anthropogenic fire soils and pathogens. A series of regional applications of this knowledge base investigates landscape transformations over time in South America the Mississippi Delta the Great Basin Thailand and India. The contributors focus on traditional societies where lands are most at risk from the incursions of complex state level societies. This book lays the groundwork for a more meaningful understanding of humankind's interaction with its biosphere. Scholars and environmental policymakers alike will appreciate this new critical vocabulary for grasping biocultural phenomena.

The Bionarrative Stephen Boyden, 2016-08-19 This book is for the general reader interested in the human place in nature and the future of civilisation. It is based on the biohistorical approach to the study of human situations. This approach recognises human culture as a new and extremely important force in the biosphere. The book discusses the evolution of life and the essential ecological processes on which all life including human civilisation depend. It describes the conditions of life and ecology of humans in the four ecological phases in human history with emphasis on the impacts of human culture on biological systems. It explains how as cultures evolved they often came to embrace not only factual information of good practical value but also assumptions that are sheer nonsense sometimes leading to activities that caused unnecessary human distress or damage to local ecosystems. These are examples of cultural maladaptation. There have been countless instances of cultural maladaptation in human history. The days of the fourth ecological phase of human history the Exponential Phase are numbered. Cultural maladaptations are now on a massive scale and business as usual will inevitably lead to the ecological collapse of civilisation. The only hope for the survival of civilisation lies in radical changes in the worldviews and priorities of the prevailing cultures of the world leading to a fifth ecological phase a phase in which human society is truly sensitive to in tune with and respectful of the processes of life. This is called a biosensitive society. The book concludes with discussion on the essential characteristics of a biosensitive society and on the means by which the necessary cultural transformation might come about.
