Measurement of Surface Reflection Properties Markus Müller-Trapet, 2015-10-01 In this thesis acoustic measurement techniques related to the absorbing as well as the scattering properties of architectural surfaces are investigated The research is divided into two parts the first part consists of determining the most relevant causes of uncertainty for the standardized measurement methods of random incidence absorption and scattering coefficients A method is developed to determine the necessary minimum number of source receiver combinations in the reverberation chamber to ensure a specified precision of the absorption or scattering coefficient The second part of the thesis focuses on a hemispherical microphone array and signal processing steps related to the measurement of angle dependent reflection properties Measurements show that the array setup can be used to obtain the angle dependent absorbing properties of samples with few source positions With the help of array signal processing methods the setup can also be used to determine the directional diffusion and scattering coefficient of small samples yielding the same result as established far field methods

Fundamentals of Fiber Science Xiangwu Zhang, 2014-01-13 Connects fiber chemistry and structure to properties that can be designed and engineered Micro and nanoscale synthetic and natural polymer and non polymer fibers explained with applications to industrial electronic biomedical and energy Information pertinent for fiber textile composite polymer and materials specialists This volume provides the basic chemical and mathematical theory needed to understand and modify the connections among the structure formation and properties of many different types of manmade and natural fibers At a fundamental level it explains how polymeric and non polymeric fibers are organized how such fibers are formed both synthetically and biologically and how primary and secondary properties from basic flow to thermal and electrical qualities are derived from molecular and submolecular organization thus establishing the quantitative and predictive relationships needed for fiber engineering The book goes on to show how fiber chemistry and modes of processing for dozens of materials such as silks ceramics glass and carbon can be used to control functional optical conductive thermal and other properties Its discussion ranges over microscale and nanoscale fibers nanofibers covering methods such as spinning and electrospinning as well as biological fiber generation through self assembly Technologies in this text apply to the analysis and design of fibers
