Maradudin, 2011-04-21 Optical metamaterials are an exciting new field in optical science A rapidly developing class of these metamaterials are those

that allow the manipulation of volume and surface electromagnetic waves in desirable ways by suitably structuring the surfaces they interact with They have applications in a variety of fields such as materials science photovoltaic technology imaging and lensing beam shaping and lasing Describing techniques and applications this book is ideal for researchers and professionals working in metamaterials and plasmonics as well as those just entering this exciting new field It surveys different types of structured surfaces their design and fabrication their unusual optical properties recent experimental observations and their applications Each chapter is written by an expert in that area giving the reader an up to date overview of the subject Both the experimental and theoretical aspects of each topic are presented

Materials Characterisation and Mechanism of Micro-Cutting in Ultra-Precision Diamond Turning Sandy Suet To, Hao Wang, Wing Bing Lee, 2017-05-23 This book presents an in depth study and elucidation on the mechanisms of the micro cutting process with particular emphasis and a novel viewpoint on materials characterization and its influences on ultra precision machining Ultra precision single point diamond turning is a key technology in the manufacture of mechanical optical and opto electronics components with a surface roughness of a few nanometers and form accuracy in the sub micrometric range In the context of subtractive manufacturing ultra precision diamond turning is based on the pillars of materials science machine tools modeling and simulation technologies etc making the study of such machining processes intrinsically interdisciplinary However in contrast to the substantial advances that have been achieved in machine design laser metrology and control systems relatively little research has been conducted on the material behavior and its effects on surface finish such as the material anisotropy of crystalline materials The feature of the significantly reduced depth of cut on the order of a few micrometers or less which is much smaller than the average grain size of work piece materials unavoidably means that conventional metal cutting theories can only be of limited value in the investigation of the mechanisms at work in micro cutting processes in ultra precision diamond turning
