

MYOPIA, HYPEROPIA, AND PRESBYOPIA

NORMAL EYE

Light rays enter the pupil and pass through the cornea and eye lens. The focal point reaches the back of the retina creating a clear image.

MYOPIA

Light rays enter the eye but the focal point is in front of the retina and does not reach the surface. Causing images in the distance to be blurred.

HYPEROPIA

The focal point of the light rays entering the eye are behind the retina causing visions closeup but clear vision in the distance.

PRESBYOPIA

Similar to Hyperopia where the focal point of the light rays reach behind the retina. However the cause is the physical change in the eye lens creating blurred images at reading distance.
