Ordinary and Partial Differential Equations W. N. Everitt, B. D. Sleeman, 2006-11-15 *Banach Space Complexes* C.-G. Ambrozie, Florian-Horia Vasilescu, 2012-12-06 The aim of this work is to initiate a systematic study of those properties of Banach space complexes that are stable under certain perturbations A Banach space complex is essentially an object of the form $1 \rightarrow O \rightarrow O_1 \rightarrow \dots \rightarrow O_p \rightarrow \dots \rightarrow O_{\infty} \rightarrow 0$ where p runs a finite or infinite interval of integers O_p are Banach spaces and $O_p \rightarrow O_{p+1}$ are continuous linear operators such that $O_p \rightarrow O_{p+1} \rightarrow O_{p+2} = 0$ for all indices p In particular every continuous linear operator $S: X \rightarrow Y$ where X, Y are Banach spaces may be regarded as a complex $0 \rightarrow X \xrightarrow{S} Y \rightarrow 0$ The already existing Fredholm theory for linear operators suggested the possibility to extend its concepts and methods to the study of Banach space complexes The basic stability properties valid for semi-Fredholm operators have their counterparts in the more general context of Banach space complexes We have in mind especially the stability of the index i.e. the extended Euler characteristic under small or compact perturbations but other related stability results can also be successfully extended Banach or Hilbert space complexes have penetrated the functional analysis from at least two apparently disjoint directions A first direction is related to the multivariable spectral theory in the sense of J. M. Nikol'skii, 2013-03-09 In the Part at hand the authors undertake to give a presentation of the historical development of the theory of imbedding of function spaces of the internal as well as the external motives which have stimulated it and of the current state of art in the field in particular what regards the methods employed today The impossibility to cover all the enormous material connected with these questions inevitably forced on us the necessity to

restrict ourselves to a limited circle of ideas which are both fundamental and of principal interest. Of course such a choice had to some extent have a subjective character being in the first place dictated by the personal interests of the authors. Thus the Part does not constitute a survey of all contemporary questions in the theory of imbedding of function spaces. Therefore also the bibliographical references given do not pretend to be exhaustive; we only list works mentioned in the text and a more complete bibliography can be found in appropriate other monographs.

O. V. Besov, V. I. Burenkov, P. I. Lizorkin and V. G. Maz'ya have graciously read the Part in manuscript form. All their critical remarks for which the authors hereby express their sincere thanks were taken account of in the final editing of the manuscript.

Asymptotic Methods for Investigating Quasiwave Equations of Hyperbolic Type Yuri A. Mitropolsky, G. Khoma, M. Gromyak, 2012-12-06

The theory of partial differential equations is a wide and rapidly developing branch of contemporary mathematics. Problems related to partial differential equations of order higher than one are so diverse that a general theory can hardly be built up. There are several essentially different kinds of differential equations called elliptic, hyperbolic and parabolic. Regarding the construction of solutions of Cauchy, mixed and boundary value problems, each kind of equation exhibits entirely different properties. Cauchy problems for hyperbolic equations and systems with variable coefficients have been studied in classical works of Petrovskii, Leret, Courant, Garding. Mixed problems for hyperbolic equations were considered by Vishik, Ladyzhenskaya and that for general two dimensional equations were investigated by Bitsadze, Vishik, Gol'dberg, Ladyzhenskaya, Myshkis and others. In last decade the theory of solvability on the whole of boundary value problems for nonlinear differential equations has received intensive development. Significant results for nonlinear elliptic and parabolic equations of second order were obtained in works of Gvazava, Ladyzhenskaya, Nakhushev, Oleinik, Skripnik and others. Concerning the solvability in general of nonlinear hyperbolic equations which are connected to the theory of local and nonlocal boundary value problems for hyperbolic equations there are only partial results obtained by Bronshtein, Pokhozhev, Nakhushev.

Mathematical Analysis during the 20th Century Jean-Paul Pier, 2001-07-05

For several centuries analysis has been one of the most prestigious and important subjects in mathematics. The present book sets off by tracing the evolution of mathematical analysis and then endeavours to understand the developments of main trends, problems and conjectures. It features chapters on general topology, classical integration and measure theory, functional analysis, harmonic analysis and Lie groups, theory of functions and analytic geometry, differential and partial differential equations, topological and differential geometry. The ubiquitous presence of analysis also requires the consideration of related topics such as probability theory or algebraic geometry. Each chapter features a comprehensive first part on developments during the period 1900-1950 and then provides outlooks on representative achievements during the later part of the century. The book provides many original quotations from outstanding mathematicians as well as an extensive bibliography of the seminal publications. It will be an interesting and useful reference work for graduate students, lecturers and all professional mathematicians and other scientists with an

Nonlinear Oscillations and Waves in Dynamical Systems P.S

Landa, 2013-06-29 A rich variety of books devoted to dynamical chaos solitons self organization has appeared in recent years These problems were all considered independently of one another Therefore many of readers of these books do not suspect that the problems discussed are divisions of a great generalizing science the theory of oscillations and waves This science is not some branch of physics or mechanics it is a science in its own right It is in some sense a meta science In this respect the theory of oscillations and waves is closest to mathematics In this book we call the reader's attention to the present day theory of non linear oscillations and waves Oscillatory and wave processes in the systems of diversified physical natures both periodic and chaotic are considered from a unified point of view The relation between the theory of oscillations and waves non linear dynamics and synergetics is discussed One of the purposes of this book is to convince reader of the necessity of a thorough study popular branches of the theory of oscillations and waves and to show that such science as non linear dynamics synergetics soliton theory and so on are in fact constituent parts of this theory The primary audiences for this book are researchers having to do with oscillatory and wave processes and both students and post graduate students interested in a deep study of the general laws and applications of the theory of oscillations and waves

Topological and Variational Methods for Nonlinear Boundary Value Problems Pavel Drabek, 1997-04-17 In the rapidly developing area of nonlinear theory of differential equations many important results have been obtained by the use of nonlinear functional analysis based on topological and variational methods The survey papers presented in this volume represent the current state of the art in the subject The methods outlined in this book can be used to obtain new results concerning the existence uniqueness multiplicity and bifurcation of the solutions of nonlinear boundary value problems for ordinary and partial differential equations The contributions to this volume are from well known mathematicians and every paper contained in this book can serve both as a source of reference for researchers working in differential equations and as a starting point for those wishing to pursue research in this direction With research reports in the field typically scattered in many papers within various journals this book provides the reader with recent results in an accessible form

Journal of Mathematical Sciences, the University of Tokyo, 1995 **G-Convergence and Homogenization of Nonlinear Partial Differential Operators** A.A. Pankov, 2013-04-17 Various applications of the homogenization theory of partial differential equations resulted in the further development of this branch of mathematics attracting an increasing interest of both mathematicians and experts in other fields In general the theory deals with the following Let A_k be a sequence of differential operators linear or nonlinear We want to examine the asymptotic behaviour of

solutions u_k to the equation $A_k u_k = f$ as k provided coefficients of A_k contain rapid oscillations. This is the case e.g. when the coefficients are of the form $a(x/\epsilon)$ where the function $a(y)$ is periodic and $\epsilon \rightarrow 0$. Of course oscillations like almost periodic or random homogeneous are of many other kinds of interest as well. It seems a good idea to find a differential operator A such that $u_k \rightarrow u$ where u is a solution of the limit equation $Au = f$. Such a limit operator is usually called the homogenized operator for the sequence A_k . Sometimes the term averaged is used instead of homogenized. Let us look more closely what kind of convergence one can expect for u_k . Usually we have some a priori bound for the solutions. However due to the rapid oscillations of the coefficients such a bound may be uniform with respect to k in the corresponding energy norm only.

Therefore we may have convergence of solutions only in the weak topology of the energy space. **Methods for Analysis of Nonlinear Elliptic Boundary Value Problems** I. V. Skrypnik, 1994-01-01. The theory of nonlinear elliptic equations is currently one of the most actively developing branches of the theory of partial differential equations. This book investigates boundary value problems for nonlinear elliptic equations of arbitrary order. In addition to monotone operator methods a broad range of applications of topological methods to nonlinear differential equations is presented: solvability estimation of the number of solutions and the branching of solutions of nonlinear equations. Skrypnik establishes by various procedures a priori estimates and the regularity of solutions of nonlinear elliptic equations of arbitrary order. Also covered are methods of homogenization of nonlinear elliptic problems in perforated domains. The book is suitable for use in graduate courses in differential equations and nonlinear functional analysis.
