Barber, 1995-04-03 This richly illustrated edition of an established classic deals with the chemistry and biology of soil nutrient availability Provides information regarding the elements present in soils and the extent to which these elements can be used by plants in order to grow Nutrient uptake by plant roots rhizosphere microorganisms and application of the mechanistic uptake model as well as such elements as phosphorus potassium and water are among the topics discussed The Molecular and Physiological Basis of Nutrient Use Efficiency in Crops Malcolm J. Hawkesford, Peter Barraclough, 2011-09-21 Efforts to increase efficient nutrient use by crops are of growing importance as the global demand for food fibre and fuel increases and competition for resources intensifies The Molecular and Physiological Basis of Nutrient Use Efficiency in Crops provides both a timely summary of the latest advances in the field as well as anticipating directions for future research The Molecular and Physiological Basis of Nutrient Use Efficiency in Crops bridges the gap between agronomic practice and molecular biology by linking underpinning molecular mechanisms to the physiological and agronomic aspects of crop yield These chapters provide an understanding of molecular and physiological mechanisms that will allow researchers to continue to target and improve complex traits for crop improvement Written by leading international researchers The Molecular and Physiological Basis of Nutrient Use Efficiency in Crops will be an essential resource for the crop science community for years to come Special Features coalesces current knowledge in the areas of efficient acquisition and utilization of nutrients by crop plants with emphasis on modern developments addresses future directions in crop nutrition in the light of changing climate patterns including temperature and water availability bridges the gap between traditional agronomy and molecular biology with focus on underpinning molecular mechanisms and their effects on crop yield includes contributions from a leading team of global experts in both research and practical settings

Soil Degradation and Restoration in Africa Rattan Lal, B. A. Stewart, 2019-07-09 Soil degradation is a widespread problem in Africa resulting in decreased agricultural productivity while demand for food continues to increase Degradation is caused by accelerated erosion acidification contamination depletion of soil organic matter and plant nutrients and salinization The major cause of soil degradation in Africa is uncontrolled and excessive grazing in the savanna regions followed by deforestation and the use of inappropriate and extractive farming practices Perpetual neglect of the health of soils in Africa can exacerbate the already serious problems of food and nutritional insecurity and environmental degradation Food and nutritional security of the growing population of Africa can only be achieved if degraded soils are restored and soils of agroecosystems are managed prudently and sustainably Ignoring soils and taking the fragile finite and precious soil resources for granted is the principal cause of poverty hunger and environmental degradation The downward spiral must be reversed through soil restoration measures based on translating science into action This book describes the soils of Africa processes of soil degradation extent and severity of soil degradation and the impacts of degradation processes on food and

nutritional security Features Explores the extent and severity of soil degradation in Africa Analyzes the cause effect relationship between anthropogenic activities and soil degradation Reviews processes of soil degradation in Africa including erosion salinization nutrient depletion and decline of soil organic matter Addresses the effect of climate change on soil degradation in Africa Explains how soil degradation causes food and nutritional insecurity Part of the Advances in Soil Sciences series this volume is specifically devoted to the processes and factors that cause soil degradation and the challenges and potential for remediation and restoration of soil health in Africa

The Use of Nutrients in Crop Plants Nand Kumar Fageria, 2016-04-19 Put Theory into Practice Scarcity of natural resources higher costs higher demand and concerns about environmental pollution under these circumstances improving food supply worldwide with adequate quantity and quality is fundamental Based on the author's more than forty years of experience The Use of Nutrients in Crop Plants The Science Beneath Organic Production David Atkinson, Christine A. The Productivity and Sustainability of Southern Forest Ecosystems in a Changing Environment Robert Mickler, Susan Fox, 2012-12-06 In conclusion current year first flush foliage of branches grown in 525 d 1 1 and 700 J Lll I of carbon dioxide had much greater rates of Pm ax compared to the P max of foliage grown in 350 J Lll I carbon dioxide These findings are similar to other long term field studies with loblolly pine Teskey 1995 Murthy 1995 Elevated carbon dioxide concentration was also significantly affected the G max however higher rates were only found at the 525 J Ll 1 I carbon dioxide concentration Generally the total chlorophyll content decreased as the carbon dioxide concentration was increased The data presented here represent first year responses to the carbon dioxide and cultural treatments This experiment will continue to determine whether increased maximum net photosynthetic rate resulting from elevated carbon dioxide will persist over the life of the foliage and over an anticipated greater range of moisture and nutrient

availability than existed during the first year of the study In addition to this determination evidence will also be collected to test for the possibility of downward acclimation of photosynthesis by foliage exposed to long term elevated carbon dioxide concentrations Detailed phenology measurements of branches and whole trees are expected to further the knowledge of how loblolly pine trees growing at the edge of the natural range respond to variations in carbon dioxide concentration water and nutrient supply

Land Use, Nature Conservation and the Stability of Rainforest Margins in Southeast Asia Gerhard Gerold, Michael Fremerey, Edi Guhardja, 2013-06-29 Southeast Asia constitutes one of the world's most extended rainforest regions It is characterized by a high degree of biodiversity and contains a large variety of endemic species Moreover these forests provide a number of important and singular ecosystem services like erosion protection and provision of high quality water which cannot be replaced by alternative ecosystems However various forms of encroachment mostly those made by human interventions seriously threaten the continuance of rainforests in this area There is ample evidence that the rainforest resources apart from large scale commercial logging are exposed to danger particularly from its margin areas These areas which are characterized by intensive man nature interaction have been identified as extremely fragile systems The dynamic equilibrium that balances human needs and interventions on the one hand and natural regeneration capacity on the other is at stake The decrease of rainforest resources is to a substantial degree connected with the destabilization of these systems Accordingly the search for measures and processes which prevent destabilization and promote stability is regarded as imperative This refers to both the human and the natural part of the forest margin ecosystem
