Soil Fertility Decline In The Tropics With Case Studies On Plantations:

Soil Fertility Decline in the Tropics Alfred E. Hartemink, 2003 Wide coverage of soils and perennial cropping systems in the tropics Synthesis of decades of research Challenges assumptions on the benefits of plantations for soil fertility It is generally assumed that soil fertility decline is widespread in the tropics and that this is largely associated with annual cropping and subsistence farming In contrast perennial plant cover as in plantation agriculture provides better protection for the soil This book reviews these concepts focusing on soil chemical changes under different land use systems in the tropics These include perennial crops annual crops and forest plantations Two case studies on sisal plantations in Tanzania and sugar cane in Papua New Guinea are presented for detailed analysis The author demonstrates that soil fertility decline is also a problem on plantations

Prospects for Soil Regeneration and Its Impact on Environmental Protection Sesan Abiodun

Aransiola, Babafemi Raphael Babaniyi, Adejoke Blessing Aransiola, Naga Raju Maddela, 2024-02-26 Soil is a complex system of inorganic and organic materials living organisms water and air It is home to more than one trillion species of microorganisms Soil also plays an important role in the global carbon cycle Because plants absorb carbon from the atmosphere convert it to plant tissue and return it to the soil as plant residue soils globally act as the world's largest sink of active carbon Soil has role to play in food production and safety Soil contamination undermined by modern agricultural practices that deplete soil carbon stocks Anthropogenic greenhouse gas emissions have been raising recorded temperatures since the Industrial Revolution Greenhouse gas emissions from agriculture forestry and fisheries have almost doubled in the last 50 years and will increase by 30% by 2050 given the current trend The primacy of arresting climate change is nowhere more evident than the adoption of 195 countries of the first legally binding global climate deal at the Paris Climate Conference in 2015 With atmospheric carbon dioxide CO₂ reaching 400 parts per million in 2016 soils can be an ally in bringing the CO₂ level down to a sustainable level if protected for regeneration Soil protection and regeneration is a technique that involves the conservative rehabilitation of soil ecosystem and farmland This technique focuses on top soil regeneration improving the water cycle supporting biosequestration enhancing ecosystem services increasing biodiversity strengthening the vitality and health of farm soil and increasing resilience to climate change and landscape Environmental protection not only improves soil health productivity and resilience to weather extremes raising farm yields and income while strengthening regional food security in the face of a changing climate but can also form part of a region's broader climate strategy This book is timely as more studies and reviews need to be reported about regenerating global polluted soil and the impacts on the environment the benefit of both biotic and abiotic structure thereby creating more awareness of environmental protection and sustainability Thus this book presents a vista to research on regeneration of lost resources in the soil and its impacts on the environment

Soil Health Restoration and Management Ram Swaroop Meena, 2019-08-23 Meeting the food requirements of an ever

increasing population is a pressing challenge for every country around the globe Soil degradation has a negative impact on food security by reducing the cultivated land areas while at the same time the world population is predicted to increase to 9.2 billion in 2050 Soil degradation adversely affects soil function and productivity and degraded soils now amount to 6 billion ha worldwide The major factors are salinization erosion depletion of nutrients due to exhaustive agricultural practices and contamination with toxic metal ions and agrochemicals which reduces the activity of soil microbe In addition poor soil management also decreases fertility As such measures are required to restore the soil health and productivity organic matter beneficial microorganisms and nutrient dynamics can all improve the physical chemical and biological properties of soil Understanding the role of soil health restoration and management in sustainability and nutritional security calls for a holistic approach to assess soil functions and examine the contributions of a particular management system within a defined timescale Further best management practices in cropping systems are important in ensuring sustainability and food and nutritional security without compromising the soil quality and productivity potential Rational soil management practices must allow environmentally and economically sustainable yields and restoration of soil health

Global Soil Security Damien J. Field, Cristine L.S. Morgan, Alex B. McBratney, 2016-11-01 This book introduces the concept of soil security and its five dimensions Capability Capital Condition Connectivity and Codification These five dimensions make it possible to understand soil's role in delivering ecosystem services and to quantify soil resource by measuring mapping modeling and managing it Each dimension refers to a specific aspect contribution to global challenges Capability value of the soil Capital current state of the soil Condition how people are connected to the soil Connectivity and development of good policy Codification This book considers soil security as an integral part of meeting the ongoing challenge to maintain human health and secure our planet's sustainability The concept of soil security helps to achieve the need to maintain and improve the world's soil for the purpose of producing food fiber and freshwater and contributing to energy and climate sustainability At the same time it helps to maintain biodiversity and protect ecosystem goods and services

Properties and Management of Soils in the Tropics Pedro A. Sanchez, 2019-01-10 The long awaited second edition of this classic textbook expands on the first edition to include advances made in the last four decades bringing the topic completely up to date The book addresses critical issues such as whether humanity can feed itself and whether it can do so in environmentally sound and sustainable ways Written from agronomic environmental and ecological standpoints the textbook employs a multidisciplinary approach including policymaking and plant genetic improvements as well as ecosystem services climate change biodiversity sustainability and resilience New chapters in this second edition focus on organic carbon in soil soil biology soils in relation to livestock production and forestry and agroforestry The new edition will again be the go to textbook for courses on tropical soils and a reference textbook for soil and agricultural scientists and development professionals working in the tropics
