

DESIGN AND MODELING THE Φ -F CHART METHOD FOR ACTIVE SOLAR ENERGY SYSTEMS

Authors: S. Poles, M. Venturin

Keywords: Scilab; Solar energy systems; ϕ -f chart method

Abstract: The aim of this paper is to show how to implement the ϕ -f chart method with Scilab. This model can be used to calculate the solar fraction for hot water production with respect to the global request. This Scilab code can be used to estimate the thermal performance of solar energy systems for domestic water, industrial process heating, and space heating systems where the thermodynamics cycle efficiency is independent of the heat supply temperature.

Analysis Methods for Solar Heating and Cooling Applications Solar Energy Research Institute,1980 Active Solar Systems George O. G. Löf,1993 Active Solar Systems is volume 6 in a series that surveys advances in solar energy research since the oil shock of the early 1970s Books in the series document in particular the period 1973 to 1985 which spawned a rich array of federally financed technological programs and developments facilitating the practical use of solar energy The twenty two contributions in Active Solar Systems introduce design analysis and control methods for active systems and cover advances in the interconnected technologies for water heating space heating and space cooling They show that with effective marketing and with environmental costs factored into individual consumer decisions there is strong potential for solar water heating and space heating and that solar cooling has potential but needs further development to become commercially viable The details of the materials involved in these technologies are covered in volume 5 Solar Collectors Energy Storage and Materials *Solar Engineering of Thermal Processes* John A. Duffie, William A. Beckman,2013-04-03 The updated fourth edition of the bible of solar energy theory and applications Over several editions Solar Engineering of Thermal Processes has become a classic solar engineering text and reference This revised Fourth Edition offers current coverage of solar energy theory systems design and applications in different market sectors along with an emphasis on solar system design and analysis using simulations to help readers translate theory into practice An important resource for students of solar engineering solar energy and alternative energy as well as professionals working in the power and energy industry or related fields Solar Engineering of Thermal Processes Fourth Edition features Increased coverage of leading edge topics such as photovoltaics and the design of solar cells and heaters A brand new chapter on applying CombiSys a readymade TRNSYS simulation program available for free download to simulate a solar heated house with solar heated domestic hot water Additional simulation problems available through a companion website An extensive array of homework problems and exercises *Systems Simulation and Economic Analysis* ,1980 *Solar Heating and Cooling Systems* Ioan Sarbu, Calin Sebarchievici,2016-10-18 Solar Heating and Cooling Systems Fundamentals Experiments and Applications provides comprehensive coverage of this modern energy issue from both a scientific and technical level that is based on original research and the synthesis of consistent bibliographic material that meets the increasing need for modernization and greater energy efficiency to significantly reduce CO2 emissions Ioan Sarbu and Calin Sebarchievici present a comprehensive overview of all major solar energy technologies along with the fundamentals experiments and applications of solar heating and cooling systems Technical economic and energy saving aspects related to design modeling

and operation of these systems are also explored This reference includes physical and mathematical concepts developed to make this publication a self contained and up to date source of information for engineers researchers and professionals who are interested in the use of solar energy as an alternative energy source Includes learning aims chapter summaries problems and solutions to support the theories presented Puts a specific emphasis on the practical application of the technologies in heating and cooling systems Contains calculating equations for the energy and economic index of solar systems

Microcomputer Methods for Solar Design and Analysis Douglas Nordham,1981 Analysis methods for solar design allow the designer or researcher to investigate and in many cases predict the thermal performance of a particular building or system These tools provide an alternative to constructing costly working models and often allow an extended forecast of system behavior under varying loads and inputs which may not be attainable through a physical representation This brochure developed by the Building Applications and Regulatory Support Branch is intended to serve as a source guide for available software packages to be used on a variety of microcomputers It is not to be viewed as a statement of advocacy for any of the methods described within Detailed technical questions regarding the programs and data files described in this brochure are best directed to the contacts listed with each entry First E.C.
