involves a certain degree of maturity since it involves tying together diverse concepts from many areas of physics The

objective is to understand in a basic way how solid materials behave To do this one needs both a good physical and

mathematical background One definition of solid state physics is that it is the study of the physical e g the electrical

dielectric magnetic elastic and thermal properties of solids in terms of basic physical laws In one sense solid state physics is

more like chemistry than some other branches of physics because it focuses on common properties of large classes of

materials It is typical that solid state physics emphasizes how physics properties link to electronic structure We have

retained the term solid state physics even though condensed matter physics is more commonly used Condensed matter

physics includes liquids and non crystalline solids such as glass which we shall not discuss in detail Modern solid state

physics came of age in the late thirties and forties and had its most extensive expansion with the development of the

transistor integrated circuits and microelectronics Most of microelectronics however is limited to the properties of

inhomogeneously doped semiconductors Solid state physics includes many other areas of course among the largest of these

are ferromagnetic materials and superconductors Just a little less than half of all working physicists are in condensed matter

A course in solid state physics typically begins with three broad areas 1 How and why atoms bind together to form solids 2 Lattice vibrations and phonons and 3 Electrons in solids One would then typically apply the above to 4 Interactions especially of electrons with phonons 5 Metals the Fermi surface and alloys 6 Semiconductors 7 Magnetism 8 Superconductivity 9 Dielectrics and ferroelectrics 10 Optical properties 11 Defects and 12 Certain other modern topics such as layered materials quantum Hall effect mesoscopics nanophysics and soft condensed matter In this book we will consider all of these

volume Parts A and B contains the edited papers presented at the annual Review of Progress in Quantitative Nondestructive Evaluation held at Bowdoin College Brunswick ME on July 24-28 1989. The Review was organized by the Center for Advanced NDE at the Ames Laboratory of the U S Department of Energy in cooperation with the Office of Basic Energy Sciences USDOE and the Materials Laboratory at Wright Patterson Air Force Base. The statistics for the 1989 Review of Progress in QNDE include a total of over 460 participants from the U S and nine foreign countries who presented some 325 papers. Over the years this conference has grown into one of the largest most significant gatherings of NDE researchers and engineers in the world. The meeting was divided into 35 sessions with as many as four sessions running concurrently and covering all stages of NDE development from basic research investigations to early engineering applications and all methods of inspection science from ultrasonics to x ray tomography. The Editors have organized the papers in the Proceedings according to topical subject headings rather than in the original order of presentation. This rearrangement yields a more user friendly reference work and follows a pattern now familiar to regular attendees of the Review. Some changes in the headings and their subcategories have been introduced to accommodate dynamic evolution of the field as we observe it. *List of Annual Reviews of Progress in Science and Technology*, 1981
