Introduction to the Series

The subject of cybernetics is quickly growing and there now exists a vast amount of information on all aspects of this broad-based set of disciplines. The phrase "set of disciplines" is intended to imply that cybernetics and all the approaches to artificial (or machine) intelligence have a near identical viewpoint. Furthermore, systems analysis, systems theory and operational research often have a great deal in common with (and are in fact not always discernably different from) what is meant by cybernetics, as far as this series is concerned; inevitably, computer science is bound to be involved also.

The fields of application are virtually unlimited and applications are discovered in the investigation or modeling of any complex system. The most obvious applications have been in the construction of artificially intelligent systems, the brain and nervous system, and socio-economic systems. This can be achieved through other simulation (copying as

Subjectivity, Information, Systems Guy Jumarie, 1986 **Cybernetics and Systems '86** R. Trappl, 2012-12-06 This volume contains all papers presented at the Eighth European Meeting on Cybernetics and Systems Research 169 draft papers were submitted for evaluation In the process of careful refereeing 33 papers were rejected and the remaining authors were invited to submit final papers Out of these 119 were accepted for presentation at the conference and publication in this volume These papers were prepared by 173 scientists authors and co authors from 22 European and non European countries with different cultural social and economic structures Everybody tried hard to make this conference and its proceedings a true representation of state of the art research worldwide The members of the Programme Committee and the Chairmen of the Symposia were selected among the internationally leading scientists Great care was taken not to make this conference a European or even Austrian one We are happy and proud to hear that these European Meetings the name is a purely traditional one are recognized as the internationally leading conferences in cybernetics and systems research Important scientists from all over the world carefully prepare their papers containing their most recent research findings and then enjoy the discussions with their colleagues *Subjectivity, Information, Systems* Guy M. M. Kogan, 1988 Since the main principles of applied information theory were formulated in the 1940s the science has been greatly developed and today its areas of application range from traditional communication engineering problems to humanities and the arts Interdisciplinary in scope this book is a single source reference for all applications areas including engineering radar computing technology television the life sciences including biology physiology and psychology and arts criticism A review of the current state of information theory is provided the author also presents several generalized and original results and gives a treatment of various problems This is a reference for both specialists and non professionals in information theory and general cybernetics *Relative Information*

Guy Jumarie, 2012-12-06 For four decades information theory has been viewed almost exclusively as a theory based upon the Shannon measure of uncertainty and information usually referred to as Shannon entropy Since the publication of Shannon's seminal paper in 1948 the theory has grown extremely rapidly and has been applied with varied success in almost all areas of human endeavor At this time the Shannon information theory is a well established and developed body of knowledge Among its most significant recent contributions have been the use of the complementary principles of minimum and maximum entropy in dealing with a variety of fundamental systems problems such as predictive systems modelling pattern recognition image reconstruction and the like Since its inception in 1948 the Shannon theory has been viewed as a restricted information theory It has often been argued that the theory is capable of dealing only with syntactic aspects of information but not with its semantic and pragmatic aspects This restriction was considered a virtue by some experts and a vice by others More recently however various arguments have been made that the theory can be appropriately modified to account for semantic aspects of information as well Some of the most convincing arguments in this regard are included in Fred Dretske's *Knowledge Flow of Information* The MIT Press Cambridge Mass 1981 and in this book by Guy Jumarie **Purposive Behaviour and Teleological Explanations** Frank Honywill George, Les Johnson, 1985 **Nature, Cognition and System I** M.E.

Carvalho, 2012-12-06 usually called the classical scientific attitude according to which there is a dichotomy between nature and cognition and suggestions for better understanding of their mutual encroachment The authors belong more or less to the non standard systems science the third order cybernetics or find themselves already beyond the third stage in the history of artificial intelligence They take the inescapability of the mutual implication of the description of nature and that of cognition seriously Fourthly closely linking up with the previous it emphatically calls attention to the forgotten microscopic dimension of science If I am not mistaken we have at this moment reached the historic stage where the tremendous renaissance of the mechanistic structural paradigm remarkably enough calls for its functional dynamic counterparts The volume strives to respond to this secret trend in various disciplines and to put into words that which is tacitly alive in the minds of the ever increasing number of people in this systems age The investigation on the intertwinement of nature and cognition finds itself in this very paradoxical niche structured by those two opposite developments **Fundamentals of Fuzzy Sets** Didier Dubois, Henri Prade, 2012-12-06 Fundamentals of Fuzzy Sets covers the basic elements of fuzzy set theory Its four part organization provides easy referencing of recent as well as older results in the field The first part discusses the historical emergence of fuzzy sets and delves into fuzzy set connectives and the representation and measurement of membership functions The second part covers fuzzy relations including orderings similarity and relational equations The third part devoted to uncertainty modelling introduces possibility theory contrasting and relating it with probabilities and reviews information measures of specificity and fuzziness The last part concerns fuzzy sets on the real line computation with fuzzy intervals metric topology of fuzzy numbers and the calculus of fuzzy valued functions Each chapter is written by one or

more recognized specialists and offers a tutorial introduction to the topics together with an extensive bibliography

Uncertainty and Intelligent Systems Bernadette Bouchon, Bernadette Bouchon-Meunier, Lorenza Saitta, Ronald R. Yager, 1988-06-08 This book contains the papers presented at the 2nd IPMU Conference held in Urbino Italy on July 4-7 1988. The theme of the conference, Management of Uncertainty and Approximate Reasoning, is at the heart of many knowledge-based systems and a number of approaches have been developed for representing these types of information. The proceedings of the conference provide on one hand the opportunity for researchers to have a comprehensive view of recent results and on the other bring to the attention of a broader community the potential impact of developments in this area for future generation knowledge-based systems. The main topics are the following frameworks for knowledge-based systems: representation scheme, neural networks, parallel reasoning schemes, reasoning techniques under uncertainty, non-monotonic and default reasoning, evidence theory, fuzzy sets, possibility theory, Bayesian inference, approximate reasoning, information theoretical approaches, knowledge acquisition and automated learning.

Causal Reasoning John Charles Francis, 1992 Synthesizes the causal reasoning used in artificial intelligence and the traditional expert system approaches based on heuristic knowledge, thus providing a methodology for analyzing causal mechanisms in physical systems. The theoretical aspects might interest researchers in qualitative reasoning; engineers might be interested in applying the method to the development of reliable real-time software.

Creativity As an Exact Science Altshuller, 1984-01-16 Proposes a new technology of creativity in which inventive thinking is seen as an organized, highly effective process which we can control. For those in computer-related fields.

Self-steering and Cognition in Complex Systems Francis Heylighen, Eric Rosseel, Frank Demeyere, 1990 In the ongoing philosophical debate between cognitivism and radical constructivism, the pervading notions of self-reference, self-organization, self-steering, autonomy, etc. are at the forefront of discussion. These multidisciplinary papers from a symposium on the title held in May 1987 examine these topics in depth and illustrate their applications. Taken as a whole, they provide insight into the emergence of a new cybernetics.

Processes of Emergence of Systems and Systemic Properties Gianfranco Minati, Mario R. Abram, Eliano

Pessa, 2009 This book contains the Proceedings of the 2007 Conference of the Italian Systems Society. Papers deal with the interdisciplinary study of processes of emergence, considering theoretical aspects and applications from physics, cognitive science, biology, artificial intelligence, economics, architecture, philosophy, music, and social systems. Such an interdisciplinary study implies the need to model and distinguish in different disciplinary contexts the establishment of structures, systems, and

systemic properties Systems as modeled by the observer not only possess properties but are also able to make emergent new properties While current disciplinary models of emergence are based on theories of phase transitions bifurcations dissipative structures multiple systems and organization the present volume focuses on both generalizing those disciplinary models and identifying correspondences and new more general approaches The general conceptual framework of the book relates to the attempt to build a general theory of emergence as a general theory of change corresponding to Von Bertalanffy's project for a general system theory

Art in the Science Dominated World E. L. Feinberg, 2021-09-01 The subject of cybernetics is quickly growing and there now exists a vast amount of information on all aspects of this broad based set of disciplines This book concerns the phenomenon of art and the special problems that arise concerning art in our era which is almost unanimously regarded as unique as the era when science and technology have as never before become the influence on human society The aim of this book is to consider the two ways of perception and cognition of the world two kinds and trends of man's spiritual life in their interrelation

Maximum Entropy, Information Without Probability and Complex Fractals Guy Jumarie, 2013-04-17 Every thought is a throw of dice Stephane Mallarme This book is the last one of a trilogy which reports a part of our research work over nearly thirty years we discard our non conventional results in automatic control theory and applications on the one hand and fuzzy sets on the other and its main key words are Information Theory Entropy Maximum Entropy Principle Linguistics Thermodynamics Quantum Mechanics Fractals Fractional Brownian Motion Stochastic Differential Equations of Order n Stochastic Optimal Control Computer Vision Our obsession has been always the same Shannon's information theory should play a basic role in the foundations of sciences but subject to the condition that it be suitably generalized to allow us to deal with problems which are not necessarily related to communication engineering With this objective in mind two questions are of utmost importance i How can we introduce meaning or significance of information in Shannon's information theory ii How can we define and or measure the amount of information involved in a form or a pattern without using a probabilistic scheme It is obligatory to find suitable answers to these problems if we want to apply Shannon's theory to science with some chance of success For instance its use in biology has been very disappointing for the very reason that the meaning of information is there of basic importance and is not involved in this approach
