**T**he ASAV has prepared these standards to support veterinarians in offering the highest standards of care to their patients. The standards set out in this document detail the ideal standards of anaesthetic care for dogs and cats within a general practice setting. The ASAV believes that owners should be advised of the best available care as set out in these standards. These standards are based on the latest peer-reviewed scientific research, surveys of Australian veterinarians and broad consultation within the veterinary profession. Anaesthesia is a continually evolving discipline, with frequent advances in pharmacology and technology. It is mandatory for all members of the anaesthesia provision team to periodically undergo training to refresh their knowledge. Referral to a board-certified veterinary anaesthesiologist should be considered for cases that are beyond the practitioner's level of expertise or comfort.

These standards will be reviewed and updated based on feedback from veterinarians and the publication of relevant new research.

### Pre-anaesthetic clinical evaluation

#### Signalment

Information pertaining to species, age, breed, neutering status and demeanour should be noted for each patient. An understanding of age and breed characteristics may provide information about additional anaesthetic concerns and prompt further diagnostic tests. Geriatric animals may pose higher anaesthetic risk because of their reduced cardiac, hepatic and renal function, which may not be apparent on routine physical examination. Similarly, certain breed characteristics can lead to greater risks for airway obstruction, increased responsiveness to anaesthetic drugs and delayed recovery, all of which can result in increased anaesthesia-related morbidity and mortality. Individual genetic variability can trigger unexpected and adverse

responses to anaesthetic drugs, which need to be identified by good recordkeeping and consistent patient monitoring. Although genetic differences are typically held responsible for prolonged recoveries and increased drug responsiveness, true genetic sensitivity has been demonstrated in only a handful of breeds, including the Greyhound and the Collie (Table 1). Demeanour should be taken into consideration when planning individual anaesthetic drug protocols, reducing patient perioperative stress and ensuring safety for veterinary personnel.

#### History and reason for anaesthesia

A detailed, accurate history should be considered an essential part of a pre-anaesthetic evaluation. Previous conditions take on significance when their residual effects compromise the patient while under anaesthesia or become exacerbated as a result of the stress of anaesthesia and recovery. For example, a patient with cardiac disease may be more intolerant of fluid therapy or a brachycephalic breed may have a higher risk of recovery complications because of brachycephalic airway syndrome. The history should include pertinent information regarding prior and concurrent drug therapy and whether the patient has had any adverse reactions or sensitivities to medications or anaesthetic agents. When possible, the anaesthetic record of a patient that has been anaesthetised previously should be retrieved and reviewed thoroughly for any adverse responses during induction, maintenance or recovery from anaesthesia.

#### Physical examination

A thorough physical examination of all body systems should be performed prior to general anaesthesia and sedation. For further information please refer to 'Standards of Care: Regular Health Check Standards for Dogs and Cats' ([www.asav.com.au/sites/default/\\_/ASAVA\\_StandardsOfCare\\_Web.pdf](http://www.asav.com.au/sites/default/_/ASAVA_StandardsOfCare_Web.pdf)).

#### Clinical diagnostics

Pre-anaesthetic diagnostics are a consideration to allow detection of underlying disorders that may influence the management of the patient or influence the prognosis associated with any given disorder. The decision on when to perform pre-anaesthetic diagnostics and which tests to include is a decision that needs to be based on the patient's history, as well as physical examination, and addressed individually by each practice on a case-by-case basis. Evaluation of patients at least 1 day prior to an elective procedure can help avoid time conflict between the surgery schedule and the benefit of additional clinical diagnostics. Recommended diagnostic testing for specific conditions is discussed later.
