

• **Warp propulsion systems status display.** This wall display incorporates a schematic of the warp propulsion system and shows performance of all key system elements.

• **Impulse propulsion systems status display.** This wall display incorporates a schematic of the impulse propulsion system and shows performance of all key system elements.

• **Master situation monitor.** This large wall display features a variety of the starship, showing the location of key systems and hardware, highlighting any elements that are currently experiencing any condition out of normal. This display also incorporates two sets of user controls to permit use of this station for troubleshooting.

• **Chief Engineer's office.** This control room includes smaller scale repeater versions of most key displays in Main Engineering, as well as workstations for the Chief Engineer and two assistants. It also includes emergency control stations, with the primary nuclear control consoles for Main Engineering. This office is located immediately adjacent to the matter/antimatter reaction assembly. A reinforced optical window permits the Chief Engineer to directly observe the matter reaction patterns within the core without the need for sensor display.

• **Duty engineer's console.** Adjacent to the Chief

Engineer's office is a smaller workstation available for use of the duty engineer. This console incorporates most systems display repeater panels.

This facility is located immediately adjacent to the matter/antimatter reaction chamber. For safety reasons, however, isolation doors are available to protect the Main Engineering staff in case of serious malfunction or planned breach. These isolation doors can be triggered automatically. Further protection is provided by a system of containment berthing, which can be activated in the event of a warp core breach or similar contingency (See: 5.1.1).

The tabletlike master systems display console in the aft part of Main Engineering is actually the same unit, retooled to be used by Admiral Cartwright and company in *Star Trek: Command* in the movie *Star Trek VI*. The display was later Star Trek production staffers have taken it over, referring to it as "the pool table."

4.0 COMPUTER SYSTEMS

4.1 COMPUTER SYSTEM

The main computer system of the Enterprise is probably the most important single operational element of the starship, next to the crew. The computer is directly analogous to the autonomic nervous system of a living being, and is responsible in some way for the operation of virtually every other system of the starship.

Crew interface for the main computer is provided by the Library Computer Access and Retrieval System software, usually abbreviated as LCARS. LCARS provides both key-based and verbal interface ability, incorporating highly sophisticated artificial intelligence routines, and graphic display organization for maximum crew ease of use. (See: 3.3).

COMPUTER CORES

The heart of the main computer system is a set of three redundant main processing cores. Any of these three cores is able to handle the primary operational computing load of the entire vessel. Two of these cores are located near the center of the Primary Hull between Decks 5 and 14, while the third is located between Decks 30 and 31 in the Engineering Hull. Each main core incorporates a series of miniature subpower field generators, which creates a symmetrical (nonrepulsed) field distortion of 3000 millihertz, within the faster-than-light (FTL) core elements. This permits the transmission and

processing of optical data within the core at rates significantly exceeding light speed.

The two main cores in the Primary Hull not in parallel clock speed with each other, providing 100% redundancy. In the event of any failure in either core, the other core is able to instantly assume the total primary computing load for the ship with no interruption, although some secondary and noncritical functions (such as holodeck simulations) may be suspended. The third core, located in the Engineering Hull, serves as a backup to the first two, and also serves the Battle Section during separated flight operations.

Core elements are based on FTL nanoprocesor units arranged into optical transverse clusters of 1,024 segments. In turn, clusters are grouped into processing modules composed of 256 modules controlled by a bank of subpower optical chips. Each core comprises seven primary and three upper levels, each level containing an average of four modules.

CORE MEMORY

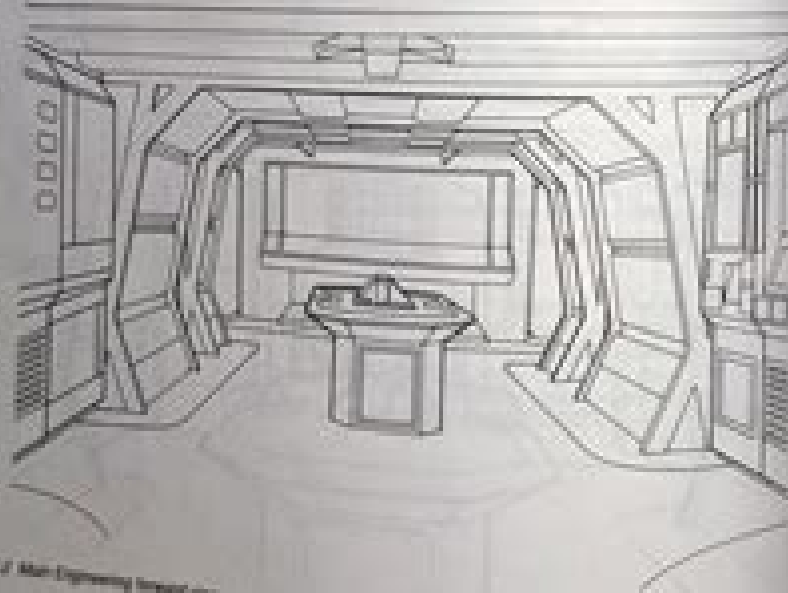

Memory storage for main core usage is provided by 2,048 dedicated modules of 144 full-power optical storage chips under LCARS software control. These modules provide average dynamic access to memory at 4,000 kilobytes/sec. Total storage capacity of each module is about 630,000 kilobytes, depending on software configuration.
