Making Math Learning Fun for Inner City School Students Glendolyn Duhon-Jeanlouis, Alice Duhon-Ross McCallum, Ashraf Esmail, 2010 Making Math Learning Fun for Inner City School Students is an effective tool for educators and a textbook for professors of higher education The concepts discussed in the book provide a body of knowledge that will enable leaders to understand the critical issues surrounding inner city school students in their ability to learn mathematical concepts Research shows that three to five teachers of mathematics leave the school system within the first two years of

teaching because of frustration experienced while helping inner city school students comprehend and master mathematical skills. Students are often discouraged by inappropriate teaching strategies that favor learning math concepts in isolation rather than making them relevant to daily life or cultural experiences. Teachers of math must clearly understand inner city school students learning styles when they are implementing a process for the student to learn. Classroom teachers in the twenty first century must have valid knowledge of how the brains of inner city school children work. For students to master and comprehend math skills learning activities must be both fun and relevant to their present body of knowledge about life and living.

Addition and Subtraction Thomas P. Carpenter, James M. Moser, Thomas A. Romberg, 2020-08-15. A hallmark of much of the research on children's thinking in the 1970s had been the focus on explicit content domains. Much of this research had been represented by an eclectic collection of studies sampled from a variety of disciplines and content areas. However, in the few years before this publication, research in several content domains has begun to coalesce into a coherent body of knowledge. Originally published in 1982, the chapters in this work represent one of the first attempts to bring together the perspectives of a variety of different researchers investigating a specific, well-defined content domain. This book presents theoretical views and research findings of a group of international scholars who are investigating the early acquisition of addition and subtraction skills by young children. Together, the contributors bring a blend of psychology, educational psychology, and mathematics education to this topic. Fields of interest such as information processing, artificial intelligence, early childhood, and classroom teaching and learning are included in this blend.
