our teaching and the knowledge and strategies needed to make it happen LCT keeps all of the good features of a teacher centered approach and applies them in ways that are in better harmony with how our brains learn It for instance embraces the teacher as expert as well as the appropriate use of lecture while also offering new effective ways to replace practices that don't optimizing student learning Neuroscience biology and cognitive science research have made it clear that it is the one who does the work who does the learning Many faculty do too much of the work for their students which results in diminished student learning To enable faculty to navigate this shift Terry Doyle presents an LCT based approach to course design that draws on current brain research on cognition and learning on addressing the affective concerns of students on proven approaches to improve student's comprehension and recall on transitioning from teller of knowledge to a facilitator of learning on the design of authentic assessment strategies such as engaging students in learning experiences that model the real world work they will be asked to do when they graduate and on successful communication techniques The presentation is informed by the questions and concerns raised by faculty from over sixty colleges with whom Terry Doyle has worked and on the response from an equal number of regional national and international conferences at which he has presented on topics related to LCT

Sleep, Memory and Synaptic Plasticity Sushil K. Jha, Vibha M. Jha, 2019-02-25 Over the years there has been growing interest among the scientific community in investigating sleep and how it affects the memory and other brain functions It is now well established that sleep helps in memory consolidation and induction of neural plasticity and that short term deprivation of either total sleep or rapid eye movement sleep alone can induce memory deficits very quickly Quantitative and qualitative changes in sleep architecture after different training tasks further suggest that discrete memory types may require specific sleep stages for optimal memory consolidation and studies indicate that sleep deprivation alters synaptic plasticity and membrane excitability in the hippocampal neurons and synaptic
