The Boundaries Of Consciousness Neurobiology And Neuropathology:

The Boundaries of Consciousness: Neurobiology and Neuropathology Steven Laureys, 2006-06-09 Consciousness is one of the most significant scientific problems today Renewed interest in the nature of consciousness a phenomenon long considered not to be scientifically explorable as well as increasingly widespread availability of multimodal functional brain imaging techniques EEG ERP MEG fMRI and PET now offer the possibility of detailed integrated exploration of the neural behavioral and computational correlates of consciousness The present volume aims to confront the latest theoretical insights in the scientific study of human consciousness with the most recent behavioral neuroimaging electrophysiological pharmacological and neuropathological data on brain function in altered states of consciousness such as brain death coma vegetative state minimally conscious state locked in syndrome dementia epilepsy schizophrenia hysteria general anesthesia sleep hypnosis and hallucinations The interest of this is threefold First patients with altered states of consciousness continue to represent a major clinical problem in terms of clinical assessment of consciousness and daily management Second the exploration of brain function in altered states of consciousness represents a unique lesional approach to the scientific study of consciousness and adds to the worldwide effort to identify the neural correlate of consciousness Third new scientific insights in this field have major ethical and social implications regarding our care for these patients

The Boundaries of Consciousness Association for the Scientific Study of Consciousness. Meeting, 2005 Mindmelding William Hirstein, 2012-01-26 In this important and controversial new book William Hirstein argues that it is possible for one person to directly experience the conscious states of another by way of what he calls mindmelding Drawing on a range of research from neuroscience psychology and philosophy he presents a highly original new account of consciousness

The Oxford Companion to Consciousness Tim Bayne, Axel Cleeremans, Patrick Wilken, 2014-02-27 Consciousness is undoubtedly one of the last remaining scientific mysteries and hence one of the greatest contemporary scientific challenges How does the brain's activity result in the rich phenomenology that characterizes our waking life Are animals conscious Why did consciousness evolve How does science proceed to answer such questions Can we define what consciousness is Can we measure it Can we use experimental results to further our understanding of disorders of consciousness such as those seen in schizophrenia delirium or altered states of consciousness These questions are at the heart of contemporary research in the domain Answering them requires a fundamentally interdisciplinary approach that engages not only philosophers but also neuroscientists and psychologists in a joint effort to develop novel approaches that reflect both the stunning recent advances in imaging methods as well as the continuing refinement of our concepts of consciousness In this light the Oxford Companion to Consciousness is the most complete authoritative survey of contemporary research on consciousness Five years in the making and including over 250 concise entries written by leaders in the field the volume covers both fundamental knowledge as well as more recent advances in this rapidly changing domain Structured as an easy to use dictionary and extensively

cross referenced the Companion offers contributions from philosophy of mind to neuroscience from experimental psychology to clinical findings so reflecting the profoundly interdisciplinary nature of the domain Particular care has been taken to ensure that each of the entries is accessible to the general reader and that the overall volume represents a comprehensive snapshot of the contemporary study of consciousness The result is a unique compendium that will prove indispensable to anyone interested in consciousness from beginning students wishing to clarify a concept to professional consciousness researchers looking for the best characterization of a particular phenomenon

States of Consciousness Dean Cvetkovic,Irena Cosic,2011-06-22 In this accessible overview of current knowledge an expert team of editors and authors describe experimental approaches to consciousness These approaches are shedding light on some of the hitherto unknown aspects of the distinct states of human consciousness including the waking state different states of sleep and dreaming meditation and more The book presents the latest research studies by the contributing authors whose specialities span neuroscience neurology biomedical engineering clinical psychology and psychophysiology psychosocial medicine and anthropology Overall this anthology provides the reader with a clear picture of how different states of consciousness can be defined experimentally measured and analysed A future byproduct of this knowledge may be anticipated in the development of systematic corrective treatments for many disorders and pathological problems of consciousness

Brain-like Super Intelligence from Bio-electromagnetism Anirban Bandyopadhyay,Kanad Ray,2024-03-07 This book discusses various aspects of bioinspired technologies but with an additional emphasis on the medical science starting from the popular article on neurobiology to pure biophysics that ends with the superintelligence of biological systems that could be reverse engineered It covers eight different aspects of natural intelligence starting from the fundamental electromagnetic properties of a protein to the vibrations and the resonance of the entire biomaterial system It also covers a wide spectrum of hierarchical communication among different biological systems for intelligence and then medical science is applied

Responsible Brains William Hirstein,Katrina L. Sifferd,Tyler K. Fagan,2023-09-19 An examination of the relationship between the brain and culpability that offers a comprehensive neuroscientific theory of human responsibility When we praise blame punish or reward people for their actions we are holding them responsible for what they have done Common sense tells us that what makes human beings responsible has to do with their minds and in particular the relationship between their minds and their actions Yet the empirical connection is not necessarily obvious The guilty mind is a core concept of criminal law but if a defendant on trial for murder were found to have serious brain damage which brain parts or processes would have to be damaged for him to be considered not responsible or less responsible for the crime What mental illnesses would justify legal pleas of insanity In Responsible Brains philosophers William Hirstein Katrina Sifferd and Tyler Fagan examine recent developments in neuroscience that point to neural mechanisms of responsibility Drawing on this research they argue that evidence from neuroscience and cognitive science can illuminate and inform the nature of responsibility and

agency They go on to offer a novel and comprehensive neuroscientific theory of human responsibility The authors core hypothesis is that responsibility is grounded in the brain s prefrontal executive processes which enable us to make plans shift attention inhibit actions and more The authors develop the executive theory of responsibility and discuss its implications for criminal law Their theory neatly bridges the folk psychological concepts of the law and neuroscientific findings

Philosophy, Neuroscience and Consciousness Rex Welshon,2016-09-17 Explaining consciousness is one of the last great unanswered scientific and philosophical problems Immediately known familiar and obvious consciousness is also baffling opaque and strange This introduction to the problems posed by consciousness discusses the most important work of cognitive science neurophysiology and philosophy of mind of the past thirty years and presents an up to date assessment of the issues and debates The reader is first introduced to the way that consciousness has been thought about in the history of philosophy and psychology The author then presents an informal and largely non technical account of the properties of consciousness that are thought to be the most paradigmatic and problematic Recent scientific work on consciousness from neurophysiological studies of the brain and evolutionary studies of the development of consciousness to computational theories of the mind are then examined and the philosophical problems that these accounts raise are systematically introduced The final chapters of the book consider more practical matters by addressing self deception neuroses the unconscious and notions of the self before concluding with an assessment of the future for psychology and the philosophy of mind
