connective tissues are essential for the physical functioning of the animal's body. The condition of the various connective tissues is governed by biochemical factors anabolism and catabolism that are controlled by specific enzymes. Any change outside the normal range of metabolism for instance induced by immunological reactions may induce a pathological disturbance. The result can be acute or chronic inflammation or loss of normal function expressed in loosening dilatation breaking wear stiffness shrinking scars stenosis and cirrhosis or any other kind of fibrosis. A first step toward improving our understanding of the feedback mechanism that maintains the biological status and texture of a given connective tissue is to combine what is known about synthesis and enzymatic degradation of the components of fibers and ground substance. Common pathological phenomena like chronic inflammation of immune reactions can be either the result of the cause of disturbances in the sensitive balance of connective tissue metabolism. Nowadays connective tissues are less and less regarded as bradytrophic tissue but rather as a stimulating and many-sided problem of research. Before we can understand the pathogenesis of the connective tissue diseases that result in the destructive processes mentioned above basic research will be necessary. This research will be furthered by a constant exchange of information and the results of observations. To promote this exchange of information between scientists symposia on connective tissue research are organized at regular intervals.

Biomaterials, Medical Devices and Tissue Engineering: An Integrated Approach F.H. Silver, 2012-12-06 are then selected and must meet the general biocompatibility requirements. Prototypes are built and tested to include biocompatibility evaluations based on ASTM standard procedures. The device is validated for sterility and freedom from pyrogens before it can be tested on animals or humans. Medical devices are classified as class I II or III depending on their invasiveness. Class I devices can be marketed by submitting notification to the FDA. Class II and III devices require either that they show equivalence to a device marketed prior to 1976 or that they receive pre-marketing approval. The time from device conception to FDA approval can range from months class I device to in excess of ten years class III device. Therefore much planning is necessary to pick the best regulatory approach.
