Barlow, 2008-12-15 Cichlid fishes are amazing creatures. In terms of sheer number of species they are the most successful of all families of vertebrate animals and the extent and speed with which they have evolved in some African lakes has made them the darlings of evolutionary biologists. But what truly captivates biologists like George Barlow not to mention thousands of aquarists the world over is the complexity of their social lives and their devotion to family. Most species of cichlids are monogamous and many pairs share the responsibility of raising offspring. In this wonderful book Barlow describes the unusually high intelligence of these fishes, their complex mating and parenting rituals, their bizarre feeding and fighting habits and the unusual adaptations and explosive rate of speciation that have enabled them to proliferate and flourish. A celebration of their diversity, *The Cichlid Fishes* is also a marvelous exploration of how these unique animals might help resolve the age-old puzzle of how species arise and evolve.

Abate, David L.G. Noakes, 2021-09-19. This volume constitutes the most recent and most comprehensive consideration of the largest family of bony fishes, the Cichlidae. This book offers an integrated perspective of cichlid fishes, ranging from conservation of threatened species to management of cichlids as invasive species themselves. Long-standing models of taxonomy and systematics are subjected to the most recent applications and interpretations of molecular evidence and multivariate analyses, and cichlid adaptive radiations at different scales are elucidated. The incredible diversity of endemic cichlid species in African lakes is revisited as possible examples of sympatric speciation and as serious cases for management in complex anthropogenic environments. Extreme hydrology and bathymetry as driver of micro allopatric speciation is explored in the African riverine hotspot of diversity of the lower Congo River. Dramatic new molecular evidence draws attention to the complex taxonomy and systematics of Neotropical cichlids, including the crater lakes of Central America. Molecular genetics, genomics, imaging tools, and field study techniques assess the roles of natural sexual and kin selection in shaping cichlid traits and beyond. The complex behavioral adaptations of cichlids are considered from a number of sub-disciplines, including sensory biology, neurobiology, development, and evolutionary ecology. Most importantly, this volume puts forth a wealth of new interpretations, explanatory hypotheses, and proposals for practical management and applications that will shape the future for these remarkable fishes in nature as well as their use as models for the study of biology. **Lake Tanganyika Cichlid Aquarium** Georg Zurlo, 2001. Lake Tanganyika Cichlids come in many interesting varieties, and aquarium hobbyists who want to keep them in an environment where they can thrive will appreciate the detailed advice offered in this manual. Books in the Complete Pet Owner's Manuals series present basic information about pets for new or soon-to-be owners. Advice and instruction covers feeding, housing, health care, training, grooming, protection against hazards, and more. Texts emphasize pet care basics and are easy for all readers to understand, but most titles also present facts that even experienced pet owners and breeders will find new and useful. All books in this series are filled with high-quality full-color photos and instructive line art.

Patterns and Processes of Speciation in Ancient Lakes Thomas Wilke, Risto Väinölä, Frank Riedel, 2009-04-02. Ancient lakes are exceptional freshwater environments that have continued to exist for hundreds of thousands of years. They have long been recognized as centres of biodiversity and hotspots of evolution. During recent decades, speciation in ancient lakes has emerged as an important and exciting topic in evolutionary biology. The contributions in this volume deal with patterns and processes of biological diversification in three prominent ancient lake systems. Of these, the famous East African Great Lakes already have a strong tradition of evolutionary studies, but the two other systems have so far received much less attention. The exceptional biodiversity of the European sister lakes Ohrid and Prespa of the Balkans has long been known, but

has largely been neglected in the international literature until recently The rich biota and problems of its evolution in the two central lake systems on the Indonesian island of Sulawesi in turn have only lately started to draw scientific attention This volume aims at deepening the awareness of the unusual biological diversity in ancient lakes in general and of the role of these lakes as natural laboratories for the study of speciation and diversification in particular It should stimulate further research that will lead to a better understanding of key evolutionary processes in these lakes and to knowledge that might help in mitigating the deterioration of their diversity in the future

Aquatic Biodiversity II H. Segers, K. Martens, 2006-01-20 Freshwater Biodiversity is a much underestimated component of global biodiversity both in its diversity and in its potential to act as models for fundamental research in evolutionary biology and ecosystem studies Freshwater organisms also reflect quality of water bodies and can thus be used to monitor changes in ecosystem health The present book comprises a unique collection of primary research papers spanning a wide range of topics in aquatic biodiversity studies and including a first global assessment of specific diversity of freshwater animals The book also presents a section on the interaction between scientists and science policy managers A target opinion paper lists priorities in aquatic biodiversity research for the next decade and several reactions from distinguished scientists discuss the relevance of these

items from different points of view fundamental ecology taxonomy and systematics needs of developing countries present day biodiversity policy at European and at global scales It is believed that such a platform for the interaction between science and science policy is an absolute necessity for the efficient use of research budgets in the future

Fish Reproduction Maria J Rocha, Augustine Arukwe, B.G. Kapoor, 2008-01-01 With the decline in world fish stocks our knowledge of fish reproduction has become fundamental Reproduction is an essential commitment to future generation It is also a continuous development process throughout ontogeny requiring energetic ecological physiological anatomical biochemical and endocrinological adaptations The first chapters highlight important issues affecting fish normal ways of reproductive development details would focus on species living in opposite environments such as tropical and polar fishes far related as teleosts and cartilaginous fishes and finally fish having different reproductive strategies Thereafter since many fishes live in detrimental environments mainly induced by the continuous input of xenobiotic substances into waterways the authors found it highly pertinent to include this topic Herein the authors fix their attention on the factors and mechanisms that may well affect reproduction related hormonal systems as also on known consequences for fish living in

Reconstructing the Tree of Life Trevor R. Hodgkinson, John A.N. Parnell, 2006-12-26 To document the world's diversity of species and reconstruct the tree of life we need to undertake some simple but mountainous tasks Most importantly we need to tackle species rich groups We need to collect name and classify them and then position them on the tree of life We need to do this systematically across all groups of organisms and b
