*Size Limits of Very Small Microorganisms* National Research Council, Division on Engineering and Physical Sciences, Space Studies Board, Commission on Physical Sciences, Mathematics, and Applications, Steering Group for the Workshop on Size Limits of Very Small Microorganisms, 1999-10-13 How small can a free living organism be On the surface this question is straightforward in principle the smallest cells can be identified and measured But understanding what factors determine this lower limit and addressing the host of other questions that follow on from this knowledge require a fundamental understanding of the chemistry and ecology of cellular life The recent report of evidence for life in a martian meteorite and the prospect of searching for biological signatures in intelligently chosen samples from Mars and elsewhere bring a new immediacy to such questions How do we recognize the morphological or chemical remnants of life in rocks deposited 4 billion years ago on another planet Are the empirical limits on cell size identified by observation on Earth applicable to life wherever it may occur or is minimum size a function of the particular chemistry of an individual planetary surface These questions formed the focus of a workshop on the size limits of very small organisms organized by the Steering Group for the Workshop on Size Limits of Very Small Microorganisms and held on October 22 and 23 1998 Eighteen invited panelists representing fields ranging from cell biology and molecular genetics to paleontology and mineralogy joined with an almost equal number of other participants in a wide ranging exploration of minimum cell size and the challenge of interpreting micro and nano scale features of sedimentary rocks found on Earth or elsewhere in the solar system This document contains the proceedings of that workshop It includes position papers presented by the individual panelists arranged by panel along with a summary for each of the four sessions of extensive roundtable discussions that involved the panelists as well as other workshop participants

Second in the Rifiers Trilogy Hugo Award winning author Peter Watts Maelstrom is a terrifying explosion of cyberpunk noir This is the way the world ends A nuclear strike on a deep sea vent The target was an ancient microbe voracious enough to drive the whole biosphere to extinction and a handful of amphibious humans called rifiers who d inadvertently released it from three billion years of solitary confinement The resulting tsunami killed millions It s not as though there was a choice saving the world excuses almost any degree of collateral damage Unless of course you miss the target Now North America s west coast lies in ruins Millions of refugees rally around a mythical figure mysteriously risen from the deep sea A world already wobbling towards collapse barely notices the spread of one more blight along its shores And buried in the seething fast forward jungle that use to be called Internet something vast and inhuman reaches out to a woman with empty white eyes and machinery in her chest A woman driven by rage and incubating Armageddon Her name is Lenie Clarke She s a rifter She s not nearly as dead as everyone thinks And the whole damn world is collateral damage as far as she s concerned At the Publisher s request this title is being sold without Digital Rights Management Software DRM applied [Origin of Life via Archaea](#) Richard Gordon,2024-08-26 This book surveys the models for the origin of life and presents a new model starting with shaped droplets and ending with life as polygonal Archaea it collects the most published micrographs of Archaea discovered only in 1977 which support this conclusion and thus provides the first visual survey of Archaea Origin of Life via Archaea s purpose is to add a new hypothesis on what are called shaped droplets as the starting point for flat polygonal Archaea supporting the Vesicles First hypothesis The book contains over 6000 distinct references and micrographs of 440 extant species of Archaea 41% of which exhibit polygonal phenotypes It surveys the intellectual battleground of the many ideas of the origin of life on earth chemical equilibrium autocatalysis and biotic polymers This book contains 17 chapters some coauthored on a wide range of topics on the origin of life including Archaea s origin patterns and species It shows how various aspects of the origin of life may have occurred at chemical equilibrium not requiring an energy source contrary to the general assumption For the reader s value its compendium of Archaea micrographs might also serve many other interesting questions about Archaea One chapter presents a theory for the shape of flat polygonal Archaea in terms of the energetics at the surface edges and corners of the S layer Another shows how membrane peptides may have originated The book also includes a large table of most extant Archaea that is searchable in the electronic version It ends with a chapter on problems

### **The Biophysics of Cell Membranes**

Richard M. Epand, Jean-Marie Ruysschaert, 2017-09-25 This volume focuses on the modulation of biological membranes by specific biophysical properties The readers are introduced to emerging biophysical approaches that mimic specific states like membrane lipid asymmetry membrane curvature lipid flip flop lipid phase separation that are relevant to the functioning of biological membranes The first chapter describes innovative methods to mimic the prevailing asymmetry in biological membranes by forming asymmetrical membranes made of monolayers with different compositions One of the chapters illustrates how physical parameters like curvature and elasticity can affect and modulate the interactions between lipids and proteins This volume also describes the sensitivity of certain ion channels to mechanical forces and it presents an analysis of how cell shape is determined by both the cytoskeleton and the lipid domains in the membrane The last chapter provides evidence that liposomes can be used as a minimal cellular model to reconstitute processes related to the origin of life Each topic covered in this volume is presented by leading experts in the field who are able to present clear authoritative and up to date reviews The novelty of the methods proposed and their potential for a deeper molecular description of membrane functioning are particularly relevant experts in the areas of biochemistry biophysics and cell biology while also presenting clear and thorough introductions making the material suitable for students in these fields as well

### **How Life Began**

Alexandre Meinesz, 2024-05-31 The origin of life is a hotly debated topic The Christian Bible states that God created the heavens and the Earth all in about seven days roughly six thousand years ago This episode in Genesis departs markedly from scientific theories developed over the last two centuries which hold that life appeared on Earth about 3.5 billion years ago in the form of bacteria followed by unicellular organisms half a millennia later It is this version of genesis that Alexandre Meinesz explores in this engaging tale of life's origins and evolution How Life Began elucidates three origins or geneses of life bacteria nucleated cells and multicellular organisms and shows how evolution has sculpted life to its current biodiversity through four main events mutation recombination natural selection and geologic cataclysm As an ecologist who specializes in algae the first organisms to colonize Earth Meinesz brings a refreshingly novel voice to the history of biodiversity and emphasizes here the role of unions in organizing life For example the ingestion of some bacteria by other bacteria led to mitochondria that characterize animal and plant cells and the chloroplasts of plant cells As Meinesz charmingly recounts life's grandeur is a result of an evolutionary tendency toward sociality and solidarity He suggests that it is our cohesion and collaboration that allows us to solve the environmental problems arising in the decades and centuries to come Rooted in the science of evolution but enlivened with many illustrations from other disciplines and the arts How Life Began intertwines the

rise of bacteria and multicellular life with Vermeer's portrait of Antoni van Leeuwenhoek the story of Genesis and Noah Meinesz's son's early experiences with Legos and his own encounters with other scientists All of this brings a very human and humanistic tone to Meinesz's charismatic narrative of the three origins of life

*The Quarantine and Certification of Martian Samples* National Research Council, Division on Engineering and Physical Sciences, Space Studies Board, Committee on Planetary and Lunar Exploration, 2002-05-16 One of the highest priority activities in the planetary sciences identified in published reports of the Space Studies Board's Committee on Planetary and Lunar Exploration COMPLEX and in reports of other advisory groups is the collection and return of extraterrestrial samples to Earth for study

in terrestrial laboratories In response to recommendations made in such studies NASA has initiated a vigorous program that will within the next decade collect samples from a variety of solar system environments In particular the Mars Exploration Program is expected to launch spacecraft that are designed to collect samples of martian soil rocks and atmosphere and return them to Earth perhaps as early as 2015 International treaty obligations mandate that NASA conduct such a program in a manner that avoids the cross contamination of both Earth and Mars The Space Studies Board s 1997 report Mars Sample Return Issues and Recommendations examined many of the planetary protection issues concerning the back contamination of Earth and concluded that although the probability that martian samples will contain dangerous biota is small it is not zero 1 Steps must be taken to protect Earth against the remote possibility of contamination by life forms that may have evolved on Mars Similarly the samples collected at great expense must be protected against contamination by terrestrial biota and other matter Almost certainly meeting these requirements will entail opening the sample return container in an appropriate facility on Earth presumably a BSL 4 laboratory where testing biosafety certification and quarantine of the samples will be carried out before aliquots are released to the scientific community for study in existing laboratory facilities The nature of the required quarantine facility and the decisions required for disposition of samples once they are in it were regarded as issues of sufficient importance and complexity to warrant a study by the Committee on Planetary and Lunar Exploration COMPLEX in isolation from other topics Previous studies have been much broader including also consideration of the mission that collects samples on Mars and brings them to Earth atmospheric entry sample recovery and transport to the quarantine facility The charge to COMPLEX stated that the central question to be addressed in this study is the following What are the criteria that must be satisfied before martian samples can be released from a quarantine facility
