### **CD4+CD25+ Regulatory T Cells: Origin, Function and Therapeutic Potential** B. Kyewski, Elisabeth

Suri-Payer, 2006-01-09 The vertebrate immune system defends the organism against invading pathogens while at the same time being self tolerant to the body's own constituents thus preserving its integrity Multiple mechanisms work in concert to ensure self tolerance Apart from purging the T cell repertoire from auto reactive T cells via negative selection in the thymus dominant tolerance exerted by regulatory T cells plays a major role in tolerance imposition and maintenance Among the various regulatory suppressive cells hitherto described CD4 CD25 regulatory T cells Treg and interleukin 10 producing T regulatory 1 Tr1 cells have been studied in most detail and are the subject of most articles in this issue Treg also called natural regulatory T cells will be traced from their intra thymic origin to the site of their action in peripheral lymphoid organs and tissues The repertoire of Treg is clearly biased towards recognition of self antigens thereby potentially preventing autoimmune diseases such as gastritis and oophoritis Regulatory T cells however also control infections allergies and tolerance to transplanted tissues and this requires their induction in the periphery under conditions which are not yet fully understood The concept of dominant tolerance by far not novel will offer new insights and hopefully tools for the successful treatment of autoimmune diseases improved cancer immunotherapy and transplant survival The fulfillment of these high expectations will however require their unambiguous identification and a better understanding of their mode of action

Biogenesis Evolution Homeostasis Alfred Locker, 2012-12-06 In 1963 1965 and 1967 Symposia on Quantitative Biology of Metabolism were organized on the pretty island of Helgoland Biologische Anstalt by me in collaboration with O KINNE and F KROGER Unfortunately this worthy approach towards bringing together interested scholars in a regular way ceased mainly for financial reasons although the need for and interest in conferences like these for the exchange of ideas on special topics unchangeably persists So I had to look for other possibilities and one of them was to try to arrange a similar conference under the auspices of NASA This institution however eventually re treated although during my discussion with its representatives a new special theme gained shape This is the topic to which this volume is devoted Bio genesis It is also treated in a new way that probably could be a model for similar undertakings a symposium by correspondence In this new approach to scientific information exchange manuscripts were collected by the editor and sent to every contributor for his comments The author could then reply by means of a concluding remark So in many instances very valuable ideas concerning the topics of the several papers could be gathered and it is to be hoped that this procedure has conferred upon this volume a certain uniqueness Of course I had to observe the agreement with Springer Verlag not to exceed the extent of the volume allotted to us

mucosal tissues are the major portals of pathogen entry and frequent transformation the activities and persistence of tissue resident memory T cells is crucial for mediating protection at these sites

**Protein Phosphatases and Stress Management in Plants** Girdhar K. Pandey, 2020-09-26 The regulation of the phosphorylation dephosphorylation process resulting in cellular switches that monitor normal plant physiology growth and development has immense potential in crop systems With much of the information in the nascent stages coming largely from Arabidopsis and rice particularly the use of cell biology genetic screens biochemical approaches aided by an omics approach should help unravel the detail functional information available about signaling pathways in plants The regulation could be exploited to develop crop varieties better equipped to handle changing environments and enhance agricultural productivity In the post genomic era one of the major challenges is investigation and understanding of multiple genes and gene families regulating a particular physiological and developmental aspect of plant life cycle One of the important physiological processes is regulation of stress response which leads to adaptation or adjustment in response to adverse stimuli With the holistic understanding of the signaling pathways involving phosphatases one gene family or multiple genes or gene families plant biologist can lay a foundation for designing and generating future crops which can withstand the higher degree of environmental stresses Especially abiotic stresses which are the major cause of crop loss throughout the world without losing crop yield and productivity This book incorporates the contributions from leading plant biologists in the field of stress mediated dephosphorylation by phosphatases as an important task to elucidate the aspects of stress signaling by functional genomic approaches
