Paul Baepler, J. D. Walker, D. Christopher Brooks, Kem Saichaie, Christina I. Petersen, 2023-07-03 While Active Learning Classrooms or ALCs offer rich new environments for learning they present many new challenges to faculty because among other things they eliminate the room's central focal point and disrupt the conventional seating plan to which faculty and students have become accustomed. The importance of learning how to use these classrooms well and to capitalize on their special features is paramount. The potential they represent can be realized only when they facilitate improved learning outcomes and engage students in the learning process in a manner different from traditional classrooms and lecture halls. This book provides an introduction to ALCs briefly covering their history and then synthesizing the research on these spaces to provide faculty with empirically based practical guidance on how to use these unfamiliar spaces effectively. Among the questions this book addresses are: How can instructors mitigate the apparent lack of a central focal point in the space? What types of learning activities work well in the ALCs and take advantage of the affordances of the room? How can teachers address familiar classroom management challenges in these unfamiliar spaces? If assessment and rapid feedback are critical in active learning, how do they work in a room filled with circular tables and no central focus point? How do instructors balance group learning with the needs of the larger class? How can students be held accountable when many will necessarily have their backs facing the instructor? How can instructors evaluate the effectiveness of their teaching in these spaces? This book is intended for faculty preparing to teach in or already working in this new classroom environment for administrators planning to create ALCs or experimenting with provisionally designed rooms and for faculty developers helping teachers transition to using these new spaces. *Undergraduate Mathematics for the Life Sciences* Glenn Ledder, Jenna P.

Carpenter, Timothy D. Comar, 2013 There is a gap between the extensive mathematics background that is beneficial to biologists and the minimal mathematics background biology students acquire in their courses. The result is an undergraduate education in biology with very little quantitative content. New mathematics courses must be devised with the needs of biology students in mind. In this volume authors from a variety of institutions address some of the problems involved in reforming mathematics curricula for biology students. The problems are sorted into three themes: Models, Processes, and Directions. It is difficult for mathematicians to generate curriculum ideas for the training of biologists so a number of the curriculum models that have been introduced at various institutions comprise the Models section. Processes deals with taking that great course and making sure it is institutionalized in both the biology department as a requirement and in the mathematics department as a course that will live on even if the creator of the course is no longer on the faculty. Directions looks to the future with each paper laying out a case for pedagogical developments that the authors would like to see. **The Art of Teaching Science** Vaile Dawson, Jennifer Donovan, 2020-07-16 The Art of Teaching Science has proven itself to be one of the most popular introductory texts for Australian pre-service and in-service teachers providing guidance on engaging students and helping develop scientifically literate citizens. Beginning with an examination of the nature of science, constructivist and socio

cultural views of teaching and learning and contemporary science curricula in Australian schools the expert authors go on to explore effective teaching and learning strategies approaches to assessment and provide advice on the use of ICT in the classroom Fully revised and updated this edition also reflects the introduction of the AITSL professional standards for teachers and integrates them throughout the text New chapters explore a range of teaching strategies including explicit instruction active learning and problem based learning the effective integration of STEM in schools approaches to differentiation in science education and contemporary uses of ICT to improve student learning Those new to this text will find it is deliberately written in user friendly language Each chapter stands alone but collectively they form a coherent picture of the art in the sense of creative craft and science as in possessing the knowledge understanding and skills required to effectively teach secondary school science Helping each new generation of school science teachers as they begin their careers is crucial to education This is the updated third edition of this valuable textbook It contains a wonderful range of inspirational chapters All science teachers not only those at the start of the profession would benefit from it in Australia and beyond Michael J Reiss Professor of Science Education University College London

Gunderson, 2014-10-24 In *Borderline Personality and Mood Disorders Comorbidity and Controversy* a panel of distinguished experts reviews the last two decades of progress in scientific inquiry about the relationship between mood and personality disorders and the influence of this empirical data on our ways of conceptualizing and treating them This comprehensive title opens with an introduction defining general trends both influencing the expansion of the mood disorder spectrum and undermining clinical recognition and focus on personality disorders The overlaps and differences between MDD and BPD in phenomenology and biological markers are then reviewed followed by a review of the overlaps and distinctions between more atypical mood disorder variants Further chapters review the current state of thinking on the distinctions between bipolar disorder and BPD with attention to problems of misdiagnosis and use of clinical vignettes to

illustrate important distinguishing features Two models explaining the relationship between mood temperament and personality are offered followed by a review of the literature on risk factors and early signs of BPD and mood disorders in childhood through young adulthood as well as a review of the longitudinal studies on BPD and mood disorders The last segment of the book includes three chapters on treatment The book closes with a conclusion with a synthesis of the current status of thinking on the relationship between mood and borderline personality disorder An invaluable contribution to the literature Borderline Personality and Mood Disorders Comorbidity and Controversy insightfully addresses the mood and personality disorders realms of psychiatry and outlines that it has moved away from contentious debate and toward the possibility of synthesis providing increasing clarity on the relationship between mood and personality to inform improvements in clinical management of the convergence of these psychiatric domains in common practice
