

What to know about speech disorders

Speech and sound disorders affect 8 to 9 percent of children in the U.S. Depending on the child's age and the underlying cause of the impairment, early intervention can be critical to preventing long-standing difficulties with speech and language.

Types of speech disorders

Speech articulation:

Omitting/distorting sounds or substituting one sound for another.

Voice:

Abnormal vocal skills; changes in voice quality may indicate ongoing disorder.

Language:

Affects use or understanding of language; may affect social communication and ability to understand body language.

Fluency:

Stuttering or abnormal speech production (common among pre-schoolers); if lasts for more than a few months, it may indicate a more severe, ongoing disorder.

Diagnosis

If your child exhibits delayed speech and language development, it is important to schedule a full hearing examination with your pediatrician. One in four children will have some degree of hearing loss in their life and nearly 6 percent will be diagnosed with a specific language impairment.

From there, a speech-language evaluation with a licensed speech pathologist may be necessary to assess voice, fluency, and speech and language.

Treatment

Children between the ages of 1 and 4 with speech difficulties are often treated through play-based speech therapy. As they get older, therapy may continue to utilize games, art and music in addition to more structured techniques such as oral-motor assessments, language interventions or speech practice — depending on the type of speech disorder, the cause and the therapist.

Handbook of Children's Literacy Terezinha Nunes, Peter Bryant, 2013-03-09 PETER BRYANT TEREZINHA NUNES The time that it takes children to learn to read varies greatly between different orthographies as the chapter by Sprenger-Charolles clearly shows and so do the difficulties that they encounter in learning about their own orthography Nevertheless most people who have the chance to learn to read do in the end read well enough even though a large number experience some significant difficulties on the way Most of them eventually become reasonably efficient spellers too even though they go on make spelling mistakes at any rate if they are English speakers for the rest of their lives So the majority of humans plainly does have intellectual resources that are needed for reading and writing but it does not always find these resources easy to marshal What are these resources Do any of them have to be acquired Do different orthographies make quite different demands on the intellect Do people differ significantly from each other in the strength and accessibility of these resources If they do are these differences an important factor in determining children's success in learning to read and write These are the main questions that the different chapters in this section on Basic Processes set out to answer
