THEORETICAL SPECTROSCOPY S. MOHAN, 2019-06-07 Molecular Spectroscopy deals with absorption emission and scattering by molecules and it is used to determine the structure of the molecules Infrared spectroscopy played a vital role in the characterization of materials until Raman Spectroscopy was discovered Raman and Krishnan jointly discovered scattering spectroscopy which was named after Sir C V Raman Subsequently he was awarded Nobel Prize for his valuable discovery After 1930 spectroscopic scenario changed in materials characterization Combining group theory infrared spectroscopy and Raman spectroscopy the structure of molecules were established The discovery of laser gave a big boost to spectroscopy and first renaissance was seen in Raman spectroscopy Then laser Raman spectroscopy became popular and was widely used not only by physicists but also by material scientists chemists pharmacologists geologists etc Around 1986 the emergence of Fourier transform spectroscopy gave rise to new instrumentations such as Fourier transform infrared spectroscopy and Fourier transform Raman spectroscopy Fourier transform Raman spectroscopy is free from fluorescence and hence it is possible to record spectra of grease and rhodamine 6G very precisely In 1960s theoretical spectroscopy which was developed by Wilson Jr et al was widely studied to evaluate potential constants vibrational frequencies mean amplitudes Coriolis coupling constants centrifugal distortion constants inertial defects shrinkage effects and thermodynamic properties of various molecules
