

The diagram illustrates the interaction between a spacecraft and its environment. On the left, a spacecraft is shown in profile, with three horizontal arrows pointing towards it from the left, representing an incoming flow or radiation. To the right of the spacecraft, a series of concentric, shaded regions represent the spacecraft's wake or the interaction of the incoming flow with the spacecraft's structure. A second spacecraft is shown within this wake region, further illustrating the complex interactions between the spacecraft and its environment.

Inverse Problems in Atmospheric Constituent Transport I. G. Enting, 2002-06-20 The critical role of trace gases in global atmospheric change makes an improved understanding of these gases imperative Measurements of the distributions of these gases in

space and time provide important information but the interpretation of this information often involves ill conditioned model inversions. A variety of techniques have therefore been developed to analyze these problems. *Inverse Problems in Atmospheric Constituent Transport* is the first book to give comprehensive coverage of work on this topic. The trace gas inversion problem is presented in general terms and the various different approaches are unified by treating the inversion problem as one of statistical estimation. Later chapters demonstrate the application of these methods to studies of carbon dioxide, methane, halocarbons and other gases implicated in global climate change. This book is aimed at graduate students and researchers embarking upon studies of global atmospheric change, biogeochemical cycles and Earth systems science.
