Temperature Biology Of Animals:

Temperature Biology of Animals Andrew Cossins, 2012-12-06 Temperature is one facet in the mosaic of physical and biotic factors that describes the niche of an animal. Of the physical factors it is ecologically the most important for it is a factor that is all pervasive and one that in most environments lacks spatial or temporal constancy. Evolution has produced a wide variety of adaptive strategies and tactics to exploit or deal with this variable environmental factor. The ease with which temperature can be measured and controlled experimentally together with its widespread influence on the affairs of animals has understandably led to a large dispersed literature. In spite of this no recent book provides a comprehensive treatment of the biology of animals in relation to temperature. Our intention in writing this book was to fill that gap. We hope we have provided a modern statement with a critical synthesis of this diverse field which will be suitable and stimulating for both advanced undergraduate and post graduate students of biology. This book is emphatically not intended as a monographical review as thermal biology is such a diverse developed discipline that it could not be encompassed within the confines of a book of this size. Review of Temperature biology of animals by A.R. Cossins and K. Bowler. Chapman and Hall, 1987 A.

Clarke, 1989 *Temperature and Animal Life* Richard N. Hardy, 1972 Animal Life at Low Temperature John Davenport, 2012-12-06 To humans cold has a distinctly positive quality. Frostbite, a nip in the air, biting cold all express the concept of cold as an entity which attacks the body, numbing and damaging it in the process. Probably the richness of descriptive English in this area stems from the early experiences of a group of essentially tropical apes making their living on a cold and windswept island group half way between the Equator and the Arctic. During a scientific education we soon learn that there is no such thing as cold, only an absence of heat. Cold does not invade us, heat simply deserts. Later still we come to appreciate that temperature is a reflection of kinetic energy and that the quantity of kinetic energy in a system is determined by the speed of molecular movement. Despite this realization it is difficult to abandon the sensible prejudices of palaeolithic Homo sapiens shivering in his huts and caves. For example, appreciating that a polar bear is probably as comfortable when swimming from ice floe to ice floe as we are when swimming in the summer Mediterranean is not easy. Understanding the thermal sensations of a cold blooded earthworm is virtually impossible. We must always be wary of an anthropocentric attitude when considering the effects of cold on other species. **Temperature and Animal Life** Richard Neville Hardy, 1979

Environmental Physiology of Animals Pat Willmer, Graham Stone, Ian Johnston, 2009-03-12 The new and updated edition of this accessible text provides a comprehensive overview of the comparative physiology of animals within an environmental context. Includes two brand new chapters on Nerves and Muscles and the Endocrine System. Discusses both comparative systems physiology and environmental physiology. Analyses and integrates problems and adaptations for each kind of environment: marine, seashore and estuary, freshwater, terrestrial and parasitic. Examines mechanisms and responses beyond physiology. Applies an evolutionary perspective to the analysis of environmental adaptation. Provides modern molecular

biology insights into the mechanistic basis of adaptation and takes the level of analysis beyond the cell to the membrane enzyme and gene Incorporates more varied material from a wide range of animal types with less of a focus purely on terrestrial reptiles birds and mammals and rather more about the spectacularly successful strategies of invertebrates A companion site for this book with artwork for downloading is available at www.blackwellpublishing.com/willmer

Wildlife Review, 1989 Animals and Temperature Ian A. Johnston, Albert F. Bennett, 1996-10-10 Environmental temperature varies in time and space on timescales ranging from a few hours to long term climate change Organisms are therefore continually challenged to regulate and maintain functional capacities as their thermal environment changes This volume brings together many of the leading workers in thermal biology with backgrounds spanning the disciplines of molecular biology cell biology physiology zoology ecology and evolutionary biology to discuss the responses of a wide range of species to temperature change at all scales of organization ranging through the molecular cellular organismal population and ecosystem levels The volume provides an important and comprehensive contribution to the study of temperature adaptation which given the concern about global climate change will provide much to interest a wide range of biologists
